You have to buy both the PCB and the GAL from a company called eMedia.
Their email-adress is 'emedia@emedia.de'.

I have a selection of Atari ST titles for sale.

Possible part exchange, swap etc.. for Atari ST CD ROMS, SCSI CD ROM
Drive, 16 bit sound sampler etc...

email: steve@steverosie.demon.co.uk

All are on original media. I may be interested in part exchange/swap W.H.Y.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^

Prices DO NOT include postage.

GAME COMPILATIONS

Addicted to fun (nb,ni) 3
Bubble Bobble (1d,ss) & Rainbow Island 'Bubble Bobble II' (1d,ds)
Hollywood Collection (5d,ni) 4
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins and Space Harrier (20 levels)

Actually it's UKP60, whhich is about thhe same price here as for the
Link. It's for STEs only thhough, and Titan has apparently given up on
selling it. You have to order it directly from TUS, who do not have a
web page.

Can't wait to get mine!

AFAIK the STFM and STE power supplies are the same. I've replaced one in a
STE with one from an old STFM and it's been working perfectly well for over
a year.

Try using the JPEG6. DJPEG is able convert to GIFs, then you can use GEMView
to convert to .IMGs. BTW, I'd probably convert them as grayscale, rather
than as coloured, images. They seem to print out better, in mono anyway.

3485. Formatting a HD

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-23 00:00:00 UTC
From: Ben <bsilk@icrossroads.com>
Message-ID: <34787CC8.77E0@icrossroads.com>
Source record: 15020

I have owned an Atari for the last 13-15 years or so and recently, my HD crashed... some nasty hardware problem. Anyway, I have another, much smaller, hard drive that works fine on my mac. I would like to format it for my Atari but am having a hell of a time. Nothing I do seems to work.

Does anyone have any software designed for this purpose? I tried the supra hard disk formatter and HDX...

All help will be greatly appreciated... I miss my Atari. :(

Ben Silkin... 1040Ste w/4 megs ram.

Source record: 15022

Hi,

I would like to use an SC1435 monitor with an S770 audio sampler.
I have seen this set up working on a friend's system.
I am a bit confused though that the video output on the sampler says
RGB digital out and the monitor says analogue, is there some special way
to wire the two together ?

I also want to replace a SCSI hard drive with a bigger one, it has 40 pins
with power included (no separate plug) I thought SCSI had a 50 pin
connector, is this a non standard configuration ?

Thanks for any help,

Bill Wormald

There is no upper limit for the drive capacity. With the LINK96/97 you
can connect SCSI/SCSI-2/Ultra-SCSI drives with any capacity. TT and
Falcon supports such drives without any additional hardware.

Simply partition your drive, don't format it. Formatting is not
necessary for drives that don't have bad sectors. And because a drive's
format is always platform independent, partitioning is absolutely
sufficient.

You need the formatting program - ICDFMT.PRG. Follow the dialogues as
if you are partitioning and you will find the "single partition only"
option towards the bottom of the dialogue which displays partition
sizes.

3493. Defect TTM195 monitor. Schematics?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-24 00:00:00 UTC
From: Ulrich R&#65533;hr <roehr@ipm.de>
Message-ID: <3479FE3E.D8E8D314@ipm.de>
Source record: 15028

I have a problem with my TTM195 monitor.
It has stopped work while it in use. Not only the
the screen went black but also the little green LED.
Must be a problem with the power supply but the
fuse is ok.

Has anyone schematics for it? Or an old TTM195
with broken screen but intact electronics?

Thanks in advance

Sonja

It's merely a recommendation to do this, no one is obliged to do it. And
certainly it's nonsense to call the mailer misconfigured for this.

> The article about it (in German of course) can be bought for... (I think
> I paid DM 4,- but don't quote me on this) and was featured in
> issue 9/1993 of C't.

>
> IDE adapter PCB (approx. 48x85mm) DM 26,-
> IDE adapter GAL chip (pre-programmed) DM 19,-

The prices for the hardware are still accurate, but the fee for copying
the article has risen to DM 5,- long ago IIRC. According to the latest
issue (I'm subscriber) both is still available. Note you should specify
the order number when ordering it : the PCB 9309170dBE, the GAL 9309171GAL

> The address to the publisher of C't:
>
> EMedia GmbH
> Postfach 61 01 06

>
> Tel: [+49] 511-53 72 95 (09-12:30)
> fax: [+49] 511- 53 52 147

Add http://www.emedia.de for WWW and emedia@emedia.de for mail.

Note EMedia is *not* the publisher, but a second company which sells the
parts for the c't hardware projects. The publisher is the Heise Verlag, as
the URL indicated which you specified.

Basically I was talking about the abundance of parallel port copying software
that is available for the PCs. There can be no Atari version of those making
copying across the parallel port possible, for hardware reasons. Of course
someone writing the software for both Atari and PC with the Atari port's
limitations in mind can succeed here. I wasn't aware of the existence of
PARC.

From: 404on040@remove2reply.iwvisp.com
Message-ID: <65d579$12t1@news.iwvisp.com>
Source record: 15033

Is anyone using the GTLook II scanner driver on one of the newer Epson scanners like the 636 or 600? I am using an ES-1200C now, but would like to know if the driver is compatible with the newer model Epsons.

Thanks,

Mike

3499. Fun with KEMD...

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-25 00:00:00 UTC
From: augeas@elis.demon.co.uk
Message-ID: <51711010_000034_OASIS_NEWS@elis.demon.co.uk>
Source record: 15034
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, I finally downloaded large swathes of KEMD, and it claimed
to have installed okay. Some questions: (I'm using a Mark X with VGA)

1) Why does it boot up in such an ugly font ? I have to do alt+F1
and use a virtual console before things start to look respectable.

2) Where did half the manpages go ? Typing man gcc and getting "no entry for
gcc" is not a good sign.

3) I still can't get X11 to work. Until I progress further with KEMD, I reckon
the TAF distribution is the best way to get X11. (But I still couldn't run
gcc...) I added some lines to mint.cnf from TAF (The ones that exec kbd and
pty) and managed to get scancode in u:\dev. Typing startx or xinit, I just
get a "give up, file not found" type of message. Why ? More bits missing from
the PATH variable ?

4) Why does alt+F10 to access the console cause a nasty crash ? I try to
select ST-Hi res from STooP, but it doesn't seem to help. (MINT030.PRG too...)

5) Is Xaaes reasonably stable ? Worth a go ? I know development has slowed
to a crawl. If I get an AES at least I could play with GluSTiK... Is Naes
worth the candle ?

6) What does the UUCP package do ? Worth the 'phone bill ?

Well, sorry to say roll on Linux....

"Augeas"
(Still a Magic fan...)

As I said, there's HDD Daemon and PARCP (PARallel CoPy), both using simple
hardware adapters for PC parallel ports (recent versions of PARCP don't need
the interface, though).

However I was thinking about making a hardware adapter for Atari parallel port
in order to make it compatible with PC ports for using various PC parallel
units like ZIPs, harddisks, scanners etc.

it shold just load from what's in your NVRAM setting.
Set it to 80 col, VGA 2 col with a software like bootconf.

>
>2) Where did half the manpages go ? Typing man gcc and getting "no entry for
>gcc" is not a good sign.
Well gcc man is not there, if youhad to install ALLLL the manual, I
think you would need a second harddrive ;)
No, just kiddin', try man man
or man rm

>4) Why does alt+F10 to access the console cause a nasty crash ? I try to
>select ST-Hi res from STooP, but it doesn't seem to help. (MINT030.PRG too...)
not from the boot selector, but from the NVRAM settings. (see bootconf)

>5) Is Xaaes reasonably stable ? Worth a go ? I know development has slowed
>to a crawl. If I get an AES at least I could play with GluSTiK... Is Naes
>worth the candle ?
Xaaes, sorry to say that hmm very interesting, but as a beta, not as a
DAILY use AES.
Naes is the way to go, (commercial), or multitos will do it fine,
except that it will be much slower, and hmm a little less stable.(that
naes)
Regarding X11, well, it's only in monochrome, pretty slow, and not a
whole lot of client. So it's nice to have x11 for testing, and
learning. but well..

>
>6) What does the UUCP package do ? Worth the 'phone bill ?
UUCP is unix to unix copy protocol or something close to that, it's
basically one way (very reliable) to get your email.
You don't NEEEEED UUCP.

Th gcc manual is in info format. Just type info, hit enter and choose the
file you want view.

>3) I still can't get X11 to work. Until I progress further with KEMD, I reckon

Never tried X11 with kgmd. Only have a 4 meg MegaSTE.

>4) Why does alt+F10 to access the console cause a nasty crash ? I try to
>select ST-Hi res from STooP, but it doesn't seem to help. (MINT030.PRG too...)

The alt+F10 combo is to bring you back to GEM. If GEM hasn't been started
that's probably why it bombs.

If you want to boot kgmd with GEM just edit the /etc/ttytab file. The lines
to edit are:

#console "/usr/etc/getty console" st52 on secure
console "/usr/etc/execgem" st52 on secure

The hash mark (#) is a comment. kgmd installs with the console line
uncommented and the execgem line commented. Just reverse them as above.

>5) Is Xaaes reasonably stable ? Worth a go ? I know development has slowed
>to a crawl. If I get an AES at least I could play with GluSTiK... Is Naes
>worth the candle ?

If you run GEM you can use GlueSTiK also.

>6) What does the UUCP package do ? Worth the 'phone bill ?

If your ISP supports uucp go for it. You can download your news and mail
in about a quarter of time it takes for nntp. nntp is so slow......

Maybe thats why so many ISP's don't support it. nntp keeps you on the line
that much longer. I sure wish my is supported it. It took me 18 minutes
to download 78 articles tonite :(

Normally you should see the system font on the console.

: 2) Where did half the manpages go ? Typing man gcc and getting "no entry for
: gcc" is not a good sign.

Perhaps you didn't install the compiler package of KGMD (KEMD)?

: 3) I still can't get X11 to work. Until I progress further with KEMD, I reckon
[...]

When I installed X it worked first time with no problems. I think if you
gave more details of the problem it would help.

: 4) Why does alt+F10 to access the console cause a nasty crash ? I try to
: select ST-Hi res from STooP, but it doesn't seem to help. (MINT030.PRG too...)

Sorry, I've never seen this problem... but then I use a TT, not a Falcon.

: 5) Is Xaaes reasonably stable ? Worth a go ? I know development has slowed
: to a crawl. If I get an AES at least I could play with GluSTiK... Is Naes
: worth the candle ?

XaAES is a nice idea but development has all but stopped and, in its
present form, it's not really usable.

N.AES, on the other hand, is excellent. It's very fast, very stable and
supports all of the AES 4.1 features. Highly recommended.

: 6) What does the UUCP package do ? Worth the 'phone bill ?

UUCP stands for UNIX to UNIX copy protocol. It allows files to be
transferred between machines and programs to be executed on a remote
machine.

I use UUCP to transfer mail and usenet between my machine and my ISP's
machine. I find that it works very well for this purpose.

I can't say whether it might be worth the 'phone bill for you since I
don't know what you plan to use it for or what you would consider to be
worth the 'phone bill.

Now the trouble is gone...
Thank you very much. You have brought the smile back to my face. (;7))
I had problems on 5 cartridges. 3 of them are working fine now. Some cartridges made the program stops "looking for old format" forever (the resource of my program is in french, I don't know the exact text of the english version)... I booted again with an good cartridge and did the whole thing again, changing the cartridge just for the last operation (all cartridges had the same number of partitions) and that worked fine...

One cartridge is really bad, when I tried to reformat it, the program said "Sense code $32" and maybe I'll throw it in a real trash can, but I lost just my mail and Cab cache on this one, it could be worse...
One cartridge have 20 bad sectors on drive F and 40 bad sectors in drive G. I marked the bad sectors with hdutil.prg. Should I keep using it, the harddrive will skip the bad sectors? Or should I use only the other parts of the harddisk, with no bad sectors? Why do sectors go bad? Should I stop using this cartridge altogether? One bad cartridge is a Nomai, the other one is a Syquest. Which one is the most reliable? Anyone...?

Thank you again, from a happy brazilian alternative rocker...

From: DCroker@fortress.org.uk
Message-ID: <6093_DCroker@fortress.org.uk>
Source record: 15048

I really don't want to dispose of my SLM604 printer but it isn't compatible with my Falcon.

I'm thinking of using my ST as a server therefore, with perhaps MidiNet or similar to transfer data to the ST (using print to disk from the application, saving to the disk mounted by the midinet software).

Is it possible to automate the printing process at the ST end (including multiple copies without transferring all that data again!) or would saving the layout files themselves to the ST and printing from a seperate copy of the program held on the ST be a better bet?

I'd thought of using the Diablo emulator installed on the ST and dragging the "printed to disk" file to the printer icon, is the Diablo emulator capable of doing this without any fuss over binary data?

Any other thoughts? IIRC the Diablo emulator is capable of printing data received via the serial port, anyone tried this, rather use the modem port tho'.

Please mail me as well as posting here, newsfeed doesn't always pick everything up.

Hmmm... I tried to partition it using diamond edge but it can't even recognize there is a drive present...

HDX gives me an error when I attempt to access ports other than 0 and partitioning port 0 seems to do nothing.

It would be great if diamond edge would simply find the drive hooked up and allow me to partition it but I don't know what's wrong... any ideas?

3515. Which Scanner ?>?

Ben,

I am going to assume that
1st. That your hard drive was working on the Mac ? Was it the drive that the Mac was booting from ? If this is the case than hooking it to say a scsi host adaptor like the Link or an Adscsi or Ad scsi Plus should work fine with software like ICD version 5 and up or BigDos or HDDriver If you are running an Atari Scsi adaptor you can use ADHI version 5.0x or better. If it is a Supra Scsi interface (well God will have to help you there)
2nd Did you connect your old and new hard drive to the same interface. Loofk at the drive access light on both drives, if they are both lite you have them set for the same ID number. If this is the case than you may have to change the hard drive ID jumpers. They are located on the printed circuit board on the hard drive and usally close to the 50 pin cable that goes from the SCSI adaptor and the hard disk. The hard drives have to have different ID numbers in order to work. If they don't you will not be able to boot. You can also use a program like checkID to see what the drives ID numbers are.
3rd. If you connected you hard drive . Did you get the cable (50 pin ribbon) on the correct way. If you got it backwards there is a possibility that you can kiss your hard drive or controller or both goodby. This causes all sorts oif problems. Does the hard disk access light come on and stays on.
4th. Last but not least if you can not figure it out and are giving up all hope you can send it to me and I can fix it for $30.00 plus any parts that are required. I would call you before making any repairs with an estimate. Hope this help you out.

I have seen a few different solutions. One is to make a ROMPORT
adapter but the the best one that I can think of (if it works)
is to take the missing lines from the 2 extended gamepad ports
on the STe and Falcon. This wouldn't need any external hardware
or hacking at all just a custom made cable.

Why not someone has done this before is a mystery for me as it
should be fairly simple and give us a complete parallel port.

It is not a joke, it is actually true. But it was done in testing the
product. Thay translated the text from American to Russian and back. A
good way to test a program like that. Did you know that as far away as
the sixties, they used computers to generate popsongs. I owned once a
program like that and it actually worked to.

Greetings,

Cecil.

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Hello, recently my postings had the subject: FREE Atari Catalogs by E-Mail, FTP & the Web! New Lower Prices! This still and always holds true! I've changed the Subject because I've recently received more Atari stock. Both Classic 8 Bit & Atari ST. HardWare, SoftWare, Books & Accessories. Due to this development, I'll be trying to spend less time on the InterNet and more time organizing, testing, cataloging & pricing the new Atari stock. Besides that I suffer from depression which seems to worsen this time of year because it gets dark earlier. It would cheer me up if we got some snow. Also, I need to see my Doctor, when I can get an appointment with him, about pain in my Right Shoulder and limited mobility which is not good because I am Right handed. So I ask that you keep me in your prayers. And be patient with me if I am slow in getting back to you.

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

A note to Repeat Customers: Welcome Back! I dont keep a Mailing List or keep track of your Mailing/Shipping address. To expedite your order, include your Mailing/Shipping address and it wouldn't hurt to include your home and work number.

I am not a repairman/technician. I have some Hardware and other stuff that needs work you can have some ***FREE*** Atari stuff for the cost of Shipping & Handling. Inquiries welcome...

FREE Catalogs for Classic Atari 8 Bit or Atari ST Computers! Hard Ware, SoftWare & Books/References! In BSC's Catalogs, you may find some thing you've been looking for, Something you might want & something New to you! View Catalogs at: www.teleport.com/~bensmith/bscomputers.shtml. And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to: ftp.teleport.com/vendors/bensmith/ or if you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can't attach files to your E-Mail. I will get back to you after the weekend. Please Direct all Replies Through E-Mail to: bensmith@teleport.com.

I'm looking to trade for these Items for my Atari. I'm looking for CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien vs Predator and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs for stuff to trade at: http://www.teleport.com/~bensmith/bscomputers.shtml or E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitor, Atari 1050 Disk Drives, Atari 1050 Happy Drive, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads,SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST & Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File

called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Hi

I can physically connect my ST SCSI (TOS 2.06 link2 ICDs/w) to my ZIP drive then to a PC with Adaptec SCSI card. Can I run the ST and PC at same time?

How and what problems are there?

I am aware HDDriver and BIGdos can be used on the ST to drive the ZIP so that the PC can access the ZIP disks. Although I dont Know the precise details.

Are there any FAQ files on this topic?

I have seen articles about partitions <32k are also OK but they are not clear under what conditions this can be done.

Help for Xmas please!

Regards Lewis

FIRST THE SOFTWARE:

1. IMAGE COPY 4 CD $17 (converts between Jpg, Gif, Tiff, Img. You can even print. It's a very clean application.

2. TRUEPAINT V 1.02 $19 Excellent drawing program; all resolutions and colors. Works in ALL ataris. From B\W. to true color.

5. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon)

6. MIDI QUEST 4.0 $25 (Synthesizer sound editor) I have file list, will send upon request. Works on Falcon also.

7. STALKER 3.04 $19 Get connected with this reliable terminal program up to VT 220. A wide range of setups. All Ataris. Interface with Steno (see Steno) excellent XYZ modem transfer module. Works as a prog. and Acc!!

8. STENO 2.10 $19 Interfaces with Stalker: You can cut, copy and paste from one to the other. Also Works like Prg or Acc; you can even run it as many times as you want and you will have the "copy and paste" option between them.

9. PAGESTREAM V 2.01 $20 Excellent DTP prg. Box with comprehensive documentation.

10. CALAMUS SL $50 seven disks. The Ultimate Atari DTP prg. From making of complex DTP documents. It comes with several modules, the manual is comprehensive.

CD ROMS: Both CD roms can be read by a PC also, format compatible.

11. GEMINI Atari thousand of shareware and public domain prgs. $10
12. CRAWLY CRYPT collection V. 1 more public domain and shareware (even Falcon). $10

13. LDW power: excellent spreadsheet. $ 3.00 no manual original disk only. (all Ataris).

HARDWARE

14. Atari SM 124 tested and is in excellent condition: $20

15. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari $40.
(has original PC software)

16. SCSI II to SCSI II 50 pin cable. Use it to attach your Falcon/TT to
and external SCSI device
(The Jazz, a CD rom, etc.) 2 feet.

Free stuff:
Modem 1200 internal PC
Atari Ste language disk English-USA CA 400607-001 Rev B
Ultimate virus killer UKV 5.9

If interested send ZIP code to ask UPS for charges. I am willing to go
down in the prices if you buy
more than 2 items. For software with light weighted documentation, I can
send it for $3.00 US priority
mail. (IF YOU LIVE IN THE US) Regards, Phil.

Aha, so this is a more larger solution. Originally it sounded as if you
only wanted the parallel port to connect your adapter to.

> but the the best one that I can think of (if it works)
> is to take the missing lines from the 2 extended gamepad ports
> on the STe and Falcon. This wouldn't need any external hardware

Ok, if you got an STE or Falcon ;-) I haven't.

Lewis,

Do NOT do that! For starters, the SCSI Controllers are usually SCSI device ID 7. Two controllers, two device ID's of 7, SCSI conflict. The least that will happen is no communication and all SCSI devices are unreachable. The worst that could happen, you may fry something.

In the 80's I remember meeting someone who showed me a hack they did on their ST. They adapted an IBM MFM type hard drive to the ST. I didn't understand enough about computers to understand what they were talking about then but now I do. Is there a hack out there to adapt one of these drives to the ST? I recently picked up a 1040 st cheap and would like to put a hard drive on it. However I can't justify spending very much money of this system as all it is just a toy I'm playing with.

> Microsoft network?

> Sounds weird, but I would like to try!

If you had more RAM, and a HD, I would recommend using MiNTnet - details
of how it has been done (with Win95 rather than NT4, but should be very
similar) are on my www pages (http://www.users.zetnet.co.uk/jacquesa).

However, with just a stock 1040, I doubt you'll be able to use the network
fully (although take a look at PARCP, Ghostlink and paralink2000). URLs
for PARCP and Ghostlink have been posted to this group recently, IIRC.

First of all, the atari is not a toy. Many people around here use it for serious applications, music, dtp, internet, text processing, etc...

MFM is not a very practical way to add a HD nowadays. The only MFM or RLL adapters I know of are the ones in the original Atari Megafile hard drives (20, 30 or 60Mb). Not a hack, as they just plug into the HD port on the back of the ST. This sort of HD is old, and slow and not very reliable any more.

You can get SCSI hard drives connected with a Link host adapter interface, and there are 2 or 3 internal IDE adapter boards that are a bit tricky to get hold of.

Check out my Quick FAQ.

3541. Nemesis / screen trouble

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-30 00:00:00 UTC
From: robscha@data.rhein-main.de
Message-ID: <HK5RAFBFUP@data.rhein-main.de>
Source record: 15076

Hi guys,

I found a problem while fitting another nemesis board..

I got a second hand falcon and a 'second' hand nemesis accelerator.
Nemesis was not fit to the board.

I install all exacly according the manual and in the same way as
i dit that with some other falcons before.

All wires are exactly at the same place as on the machine(s) before..

To check all i use a SM124, simple, i don't have a VGA left in the moment.

While nemesis is OFF, i can use the SM124, TV/RGB and a VGA well.
First i put nemesis.prg to the autofolder, nem_lo and nem_hi i will start
from the desktop, only in test phase.

After switch nemesis on (nem_lo OR nem_hi) i got a 50% reduced screen.
All screen information is shrink to the middle of ANY Monitor or TV.
With nemesis OFF, all looks well, equal with any kind of screen.

Screen Example:

```
upper monitor border
---------------
< empty zone
--...--....
--.-.... << all information is center to the middle

< empty zone
----------------
lower monitor border
```

(Any screen if nemesis is ON)

Also i don't have trouble with IDE, Floppy or SCSI.
Nemesis is cross checked with another machine and works well..
Nembench with nemesis OFF: 100% at all
Falcon Testkit: No Errors

Also i try the RGB-Patch with negative results.
(Complete wih switch)

(That all looks like a problem with the video sync..
But only while nemesis is ON) ??

Any ideas?
Nemesis specialists wanted :)

I need very thick eye glasses? :>

Next session is to pick up the clocksignals with a oszi?
(I don't like to do that) :->>

BTW: The falcon board is a realy fucking old one, no serial, no rev.No

Regards, Robert

Hey, dont jump down the guy's throat - its a toy to him! Obviously he has
no wish (or reason?) to use it for work - but an Atari can be fun, which is
why he wants it...

> MFM is not a very practical way to add a HD nowadays. The only MFM or

If you've got one, I expect its practical.

Is there some kind of plain English Doc on how to get HS-Modem working?

It works fine,comes up while booting,so its installed ok.
But I don't notice any diffence in modem speed.
I've tried it with and without.

Anyone care to help me?

I have a STe 4Meg 250MegHD and 14.4K modem.
Using STing 1.6 and Freeze dried terminal.

Thanks

Go for STinG, which can be found on my web page. You can make serial
connections to the NT machine with it. If you insist in Ethernet, you
gotta wait a little longer.

MiNTnet supports Ethernet now, but on a 1040 STE you won't have much fun
running MiNTnet.

It's not there to enhance the speed of the interface, but to make it reliable.
It's true you can use higher speeds with it, but only because without it the
speeds are too unreliable.

If you installed it for STinG, make sure STING.PRG is in the AUTO folder
after the HSMODEM modules (Watch the boot process, STinG must boot after
the HSMODEM modules). Then use the SERIAL.CPX to configure speed etc.

I should add that updating to STinG V1.08 is advisable.

Cheers Peter

Hi, there is one small thing that might preclude your PC from reading your ST disks... An ST will happily format a HD disk at @720k (or whatever density, if you're using a 3rd-party formatting program). However, your PC will choke on it.

What you should do is ensure that you format your disks to the standard 720K density doing one of these two things:

1: Using a double density disk.
2: If you used a HD disk, then put a piece of opaque tape over the window on the upper-right-hand side of the disk before inserting it into the PC drive. The PC will then think that it's a 720K disk. Shouldn't have to go through all this with the bootsectors, but that's the only thing that worked for me.

What you need is a Host Adapter. This is hardware that converts ASCSI to
SCSI. There were several manufactors, the one that comes to mind is ICD
but don't know if they are still in business. Otherwise put a notice on
the net for one and someone will probibly have one. PACMan

No. Don't do this. The physical coating on the disks is different
between HD and DD floppies. This trick does work sometimes, but don't
backup any important data on HD floppies formatted to DD mode.

As well as the host adapter, you will need a SCSI to MFM adapter, Xebec used
to make these.

They are probably hard to get hold of nowadays.

AFAIR, atari used to have an all in one (ASCI to MFM) adaptes in their
original hard drives, maybe Best Electronics would have these.

>backup any important data on HD floppies formatted to DD mode.
>

Thanks for pointing it out Nicholas. I was going to follow-up my post
when I realised I had left it out, but I was talking about a
short-term transfer solution, not a storage solution. In 7 out of ten
stores that I visit here in Bangor, I can't even _find_ double density
disks anymore.

To any ATARI ST owners
""""""""""""""""""""""""

Hi, my name is Christopher and I'm posting this document to see if there are any Atarians out there in the cyber space area, who may be able to help me figure out why I can't unzip my downloaded Atari zipfiles from some of the Atari websites, or if anyone is connected to a Unix system and uses Antic's "FLASH" (any version) telecommunication program, maybe you can tell me how you have configurated Flash to properly operate with the Unix system. This may be the problem with my zipfile downloads. I am by no means a computer wiz, but I think my problem lies in the transfer of Bad CRC's and Invalid Zipfile Headers. The question is WHY is it happening and HOW do I fix it? That's my problem to "maybe" this problem.

I belong to the Vancouver CommunityNet which uses the "UNIX(r) system V Release 4.0" with the "Pine" (version 3.95) e-mail program, "Lynx" (version 2.6) text browser, and the "Pico" text editor. I was using "Webcrawler" to find the Atari websites. My Atari stuff may be slow and old, but it works just fine. I don't know if the rest of the following information will help you to figure out my problem or not, but here it is anyways.

I am using an ATARI MEGA ST2 with a SC1224 colour monitor (low/medium resolution,I use medium) and a "now" very, very slow Atari SX212 modem. My telecommunication program is the old Antic "Flash" version 1.52 (c) 1986, which I may have configurated wrong, I'm not sure. I could also have the configuration file in Lynx set up the wrong way to, but I've had no trouble downloading ASCII or TOS files, just the zipfiles after I've downloaded them. I even tried downloading the same zipfiles on my friends computer (IBM) using "Windows 95" and "Netscape", and came up with the same results.

My terminal is set to: vt100 [ASCII], FULL Duplex, Echo [OFF], Linefeed [Off], Strip High Bit [ON] (I've tried off as well), and the Translation table is [ON] when using the buffer and does not effect Xmodem transfers.

The RS232 Configuration is: 1200 Baud, 8 Bits, No parity, and 1 Stop bit as requested by the Vancouver CommunityNet.

My ASCII settings are: 1 Line pause, DC2/4 Protocol [OFF], Strip Linefeeds [ON], Metering [ON], Prompting [OFF], and [NO] Prompting character.

The Xmodem parameters are set to: [REGULAR] Transfer Type (also tried 8/CRC), [1 K-byte] Block size (also tried 128 bytes), LOOSE timing, and [Ctrl-Z] Pad last block. I've also tried [Size Byte] (NO padding).

For Zmodem downloads only with verbose (debugging) to screen, I'm executing another program within "Flash" called "XYZ.TTP" by Alan Hamilton (c) 1989, which also does X and Ymodem downloads. I have tried downloading with Zmodem and both Xmodem transfers in each program, stating the file names as I should without any luck on zipfiles.

What follows below, is an example of the exact information I see when downloading a zipfile when using Lynx. First, here's a program I downloaded using the Xmodem CRC option in Lynx and the download Xmodem transfer in Flash. I had no problem downloading and reading the "Zmdm16.doc" file.

1. WEB LINK INFO SCREEN

ZMDM16 V1.6
Zmdm is another ZModem program derived from rz/sz for Unix and
possible to run at 38.4K or higher bps.

+ [11]Zmdm16.zip 138256 bytes
+ [12]Zmdm16.doc 380 bytes

2. LYNX DOWNLOAD INFO SCREEN
---

* Lynx info lines when downloading the zipfile using Xmodem CRC.

Sending/tmp/Lynx.sx.26765/zmdm16.zip 1081 XMODEM blocks. Start your
local XMODEM recieve.
C
3. UNZIP PROGRAM INFO SCREEN (Atari GEM)
---

* ST Unzip info message after it has or hasn't uncompressed the file.
NOTE: The input/output bytes and bad CRC information changes with each
zipfile. This info is the "zndm16.zip" file

Buffer - (input --> 475197 bytes) (output --> 321761 bytes)

Unknown compression method. Bad CRC f6ca2178 (should be 00000000)
Invalid Zipfile Header.

press any key to continue.

4. ATARI (GEM) DESKTOP INFO SCREEN
---

* Info after using ST Unzip. I've added 2 another zipfile as well.

ZMDM16 ZIP 138266 (Date & Time)
COFFEE/P 56497 " "
COFFEE ZIP 34410 " "
ZMDM16/D PRG 33409 " "
UNZIP TTP 21747 " "
PC_ST/AT EXE 6471 " "
PC_ST ZIP 5530 " "

I've been trying to uncompress my downloaded zipfiles with the ST Unzip utility program (version 1.2) by S.H. Smith (c) 1989. Some of the zipfiles seem to uncompress. It is obvious by the byte size that the "ZMDM16/D.PRG" didn't uncompress properly. I also added two other ZIPfiles to the example above, which might have uncompressed properly because of the byte size. Notice the parameter names of the uncompressed programs. On an Atari St you can"t type a "/" on a file or item selector info line, whatever the "/P, /D and /AT" mean. Also notice that the "COFFEE/P" has no file extender to tell you what kind of application is needed to run the program and what's EXE? It looks like programs for a PC, not an Atari. These zipfiles were downloaded from Atari websites.

I also get the message "TOS error #35" after double clicking on the uncompressed programs. This is because something is wrong with the program of course, and what does "TOS error #35 mean, and is "TOS similar to "DOS" or can it even be used on an ATARI ST? This could be part of my download problem as well or maybe there's something with the ST Unzip program itself. Who knows? I've yet to find an uncompressed version of ST Unzip on the web. Most of the files out there are all zipped. What ever happened to the good old ARCX program. I just don't know what to do anymore. I'm at my wits end. HELLLLP, I've fallen down and I can't get unzipped!

I don't know if any of this information was useful or not, but it's the only way I know how to explain my problem, and I do THANK YOU kindly for reading my rather lengthy plea. If you can help me by offering any suggestions or solutions to this frustrating zipfile caper, I would greatly appreciate it.

You can contact me by e-mail, or give me a call if you happen to live or be in the Vancouver, BC, Canada area. If you would also like to share or trade any Atari programs or games via attached to e-mail, let me know. We can also download directly by modem to each others computer if you live in Vancouver, BC, because I can't afford the long distance charges.

I have to many files to tell you what I have right now, this document is long enough as it is. If you're interested in a certain program or game that I may have, just ask. I shall do the same. My utility programs will work on any ST, but some of my productivity programs and all my games are for COLOUR MONITORS only (low/medium resolution), except for a good old (mono) Breakout game.

I do have a few monochrome programs, including one called "BIGCOLOR" that turns your monochrome screen into a workable low/medium screen. This means you can run low and medium resolution programs on your monochrome, though, your screen action may slow down. I'm not sure about that, because I can't use the program with my colour monitor. The program I use does the opposite and does slow down the screen action, but the monochrome programs still work. I also have a bunch of "STart" Atari monthly disks published by Antic inc.. They're loaded with all kinds of ARC files and stuff. Well...I guess I had better stop writing now, so I can hopfully hear from someone out there soon. See ya!

Thanks again, from a Faithful Atarian,

Christopher Allen

I in a BIG need for spare parts of this superb computer.. I'll buy them from
you, If you have some...

I need,

TT mem board (free editable card for 72pin's SIMM's)
TT STmem board (same as prev. board)
TT SCSI 2 chip (mine refuses service)
TT VME cage
TT housage (incl cables from the SERIAL conectors...)
TT Keyboard

If you have one of the above, netmail me with your price...

Thank's

Barry

> Fast Technology 16 MHz upgrade
>kit added.

I have the same upgrade in my Mega and it works wonderful!! They must of attemped an upgrade to the upgrade. What a pity.... I can check mine out and let you know what chips are on it and where the wires should or shouldn't be. Right now mine has a single wire that goes to a 16mhz clock signal. There can also be a wire that goes to and from the ROS that allows switching of TOS versions. You can also select the buffer on/off for the new 16mhz CPU. If you connect two wires and a switch. Let me know whetre I can send a copy of the manual.

ICD is still around and still in business. I ran into Tom (ICD table
at the College of DuPage show - a roughly monthly computer show that
draws several thousand people a month) this past Sunday, Nov 30.
You might try contacting them about the interfaces if you are really
interested. BTW, you can pick up used scsi small drives for $20-50
(I paid $50 for a 300M Sunday.) Wayne

PS- I have Tom's card at home. if you need details, post me.

3561. Mega ST4 question(s)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-02 00:00:00 UTC
From: Jo Even Skarstein <josk@stud.ntnu.no>
Message-ID: <661tpb$484$1@due.unit.no>
Source record: 14900

I'm in the process of upgrading my Mega STE 4 with various
DIY-kits (Lacescan, IDE/TOS 2.06, serial-port, HD-drive...), and I
wondered if anybody knew which of the ACIAs is the keyboard-ACIA?

On my Mega (rev. 5.00) they're located next to each other, and it's
hard to tell which's which. Is it U14 or U15?

Also, it looks like there's a socket for a 68881/2 on the PCB, U5. Is
this correct, or is it for something else? I have a spare 68882 from
my Falcon, can I just plug it in?

Finally, are there any good DIY accelerators suitable for the Mega?
I'm not looking for something fancy, I just want to speed up the
CPU, or preferably the whole PCB, a bit. I've found one that looks
fairly simple (double-clocks the CPU), but the instructions are
only in Italian...

Thanks in advance,

Jo Even Skarstein
<joska@nuts.edu>

3564. Fast Technology 16 MHz upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-02 00:00:00 UTC
From: Don Walterman <dwalterm@ix.netcom.com>
Message-ID: <65vven$9rs@sjx-ixn8.ix.netcom.com>
Source record: 15093

I just salvaged an old MegaST that has a Fast Technology 16 MHz upgrade kit added. It doesn't look like the upgrade was successful. Does anyone have the instructions for this upgrade? I'd like to try to repair this board. U12 has been removed and U78 has a 74LS74 tacked on top with 5 wires running back to the 68000 socket. There also are two wires soldered to the board that look like it may have been setup for a switch (?) They are just soldered together now.

I'd be happy to pay for a copy of the manual.

I am finally getting rid of my 1040 system which includes:

> Atari 1040STE with clock > Atari MegaFile 30 loaded
> Atari SF314 disk drive > Atari SC1224 Color monitor
> external modem > fastest disk copier created
> more Atari software than you've ever seen in one place to
include: games, utilities, graphics, programming languages,
START magazine disks, ST User disks, and more

all in very good to excellent working order. I'll pay for
shipping anywhere. Please E-mail me at "thomasds@bellsouth.net"
for more information.

3566. Connecting Atari MEGA ST 4 to TV

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-02 00:00:00 UTC
From: Stanislav Borutsky <borus@usa.net>
Message-ID: <34843187.2C80EED7@usa.net>
Source record: 15095

I've found some FAQs on the issue, but still don't know how to do it.
The only video connector in my atari has 13 pins, no RF and no SCART.
How can I connect it to :
1) TV antenna
2) SCART TV connector ?

Thank you in advance.

3567. Mega ST keyboard > PC serial port?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-02 00:00:00 UTC
From: Will H <will@webjetters.com>
Message-ID: <01bcff0f$2535b3c0$0100007f@LocalHost>
Source record: 15096

Sorry if this is a bit of topic! I'm trying to convert an old atari MegaST keyboard to work on my PC serial port. I have sucessfully wired it together I think and am getting bytes from the serial port when the keys are pushed down and released but second last bit seems to be inconsistent. I am using VB5 and Mscomm32.ocx. I have set the port to 19200, no parity, 8 bits, 1 stop bit, no flow control. Am I going about this the wrong way? Is the inconsistency probally due to my dodgy wiring? Any help or recommendations appreciated.

Thanks

Will

You can connect it to a SCART connector with a 13pin DIN to SCART cable.
You can find these at some atari dealers, or you can make it yourself.
Just get the pinouts from one to the other and connect them. Don't
connect the 'mono detect' pin, so that the ST will boot in colour.

You'll find a link to pinouts in the Quick FAQ.

Why waste a magnificent Mega keyboard on a PC when you can get PC
keyboards for less than $10 ??? The Mega keyboard could probably make an
ST owner very happy.

And what a strange idea, making it work on a serial port ?

The IKBD operates at 7812.5 BPS (500 KHz clock in x64 mode), with
the clock signal provided externally by the host computer. The rest
(8 data bits, 1 stop bit, no parity, no flow control) is right.

3572. No Blitter in Falcon!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-03 00:00:00 UTC
From: rojewski@primenet.com
Message-ID: <664d90$muk@nntp02.primenet.com>
Source record: 14907

I seem to have just noticed that the blitter in my falcon cannot be activated. The General Setup CPX has an empty area under the 'bell' and 'keytop' that is supposed to have a drop-down menu for 'Chips'.

Also the System Info CPX has the Blitter checkbox disabled.

When I call Blitmode(-1) XBIOS(40), I get 2, which says installed, disabled. If I call Blitmode(3) (which should enable the blitter), and then issue the Blitmode(-1) again, I still get a 2, which means I can't enable it programmatically.

It sure sounds like a hardware problem. Any ideas?

John

3573. [Q] Help new TT owner

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-03 00:00:00 UTC
From: mghembru@tyrant.uwaterloo.ca
Message-ID: <EKMo43.D6y@novice.uwaterloo.ca>
Source record: 14908
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Figuring I'd never get my hands on a TT in anycase, I didn't pay that much attention to all the TT stuff. So, today, I go to our university's surplus sale and find a TT w/ 10 megs ST ram for $CAN 27, and a PTC1426 monitor for $CAN 5.40 (some guy beat me to the 19" ECL monitor, forget the model name). Also had an SC124 or whatever, but I already have one of those. Is the PTC a VGA monitor in disguise?

Anyway, so I boot it up, and sure enough, 10 megs ST RAM test out ok. Hard drive spins up, but doesn't boot. Desktop comes up.

So, I quickly ftp'ed a disk driver (cbhd by Claus Brod) and transferred over from my PC here at work via floppy. Running cbhd.tos locates the drive: it's identified as a seagate 157N, I believe. That's about 48 megs or so? Anyway, after doing this, I can install "C", and then access the drive. There's various stuff on it. This machine used to be hooked up to a scanner (someone beat me to the scanner too), but I did get the Navarone cartridge interface - any use for that? I can install drives D, E and F (haven't tried any more) and they all have stuff on them. Except, there are disk errors accessing each of these drives. Trying to do a "show info" on drive C caused more drive errors. So, question 1) is this driver too new? I've ftp'ed the AHDI 5.04 drivers, would those be better? I assume the Atari ACSI->SCSI module will work with most smaller sized SCSI drives if this one is hosed? What is the best HD driver to use, in general, that's either cheap or free?

Also, I seem to remember TT ram as being just plain simms? Are they 1 meg or 4 meg simms (30 pins, I assume). 1 megs are dirt cheap, but 4's aren't and are hard to find..

I'm considering running Linux on this as a secondary machine to my P210MMX, but I'm wondering if 50 megs hard drive space is enough (if I reformat the drive)? Anyone else done it? Or will MiNT/MiNTnet run X11? I'm guessing there are no cheap ethernet cards for the TT? I'd love to have a localnet..

Anyway, if you have any other suggestions such as "you absolutely must get program XXX for the TT", I'd love to hear them. I'd like to get the hard drive working reliably (and booting off the hd versus the floppy) first, and then move on to bigger and better things.

Thanks in advance,
Mattias

>the best HD driver to use, in general, that's either cheap or free?

Ok, update. I got AHDI 5.0, formatted the drive, repartitioned into one 48
meg partition (I assume the 16/32 meg partition limit was fixed in TOS
2.05/6? What is the new limit, if any?). Installed the cpx files that came
with AHDI. Nice to get that clicking off (system didn't come with mouse, so
I've been using keyboard navigation -> wish Win95 worked as well without a
mouse!!). I have a spare mouse at home though, so that's no problem.

Anyway, here are the questions I'm left with: what are my options for
networking to my PC via Linux? Obviously I _CAN_ install Linux in 50 megs,
but the question is, how useful is it? Or am I just being wishful and Linux
for the TT has never been around? Can a "dual-boot" be set up so I can boot
Linux off one partition, and still keep a small Atari partition?

Right now I'm running the PCI1426 in TT medium resolution (640x480x16). Is
this within spec? Seems to run just fine, and looks very nice.

Memory expansion: I'm already at 10 megs ST RAM, so I'm interested in
TT-RAM. How can I increase TT-RAM? Which one does Linux use? I know some

programs need ST RAM, and some will run in either. Is there a rule of thumb
I can use?

Thanks,
Mattias

Try a different res. I think it may not work in certain resolutions.

If you're using NVDI, that might be a factor, too. Try it without
NVDI installed.

As far I know you don't need a Host adaptor to connect MFM/RLL drives to you Atari. I 'rebuild' an old megafile 60 to an 120mb acsi with 2 harddisks. Both these drives are RLL drives. This little project cost me less then $10. (I already had the megafile)

The only way I know of to connect a MFM drive is to put it in a megafile 20 case. This is a MFM to acsi conversion.

So you can connect the following harddisk to an Atari:

megafile 20 -> Any MFM harddisk
megafile 30/60 -> Any RLL harddisk
Hostadaptor -> Any SCSI device (harddisk/printer/scanner etc.)

It doesn't matter how fast your Pentium is....
..........Bill Gates will slow it down anyway

I used to own a TT. 2 meg ST-Ram
8 meg TT-Ram
48mHz CaTTamaran accellerator
Quantum 425meg HD (internal)
Seagate 80meg HD (external)
CD-Rom
28.8 Hayes modem
SVGA monitor

OS: TOS 3.06
TOS 4.??
Mint 1.12
Linux 0.9? / X

With only 52 meg you will not have much room on your drive for anything
other than Linux and swap space. TT-Ram can really speed things up,
Linux is one thing it can really speed up.

Running under TOS (3 or 4) I never used more than 3 meg of memory, but
Linux/X would chew up almost all the TT-Ram. Get the GNU tools to let
you easily monitor your system resources.

To connect the TT to the outside world you add an ethernet card in the
VME
slot, or use slip/ppp over a serial port. I used Linux/ppp into work.

I currently own a 233mHz AMD-k6/W95, and do not see any real difference in perfomance over the TT, but the connection into work is easier since I can run X without invoking Linux.

If the person that bought my TT from me ever wants to sell it, I am interested in getting it back.

Brian

3578. 6 and 2 chip TOS

Hi!

My Mega ST 4 has six ROM-sockets, but only two chips. My STF
has six sockets and six chips. Can I swap the chips around without
having to modify the ST's? The STF has TOS 1.04 while the Mega has
1.02, I would prefer it the other way around :-)

Roland makes an adapter: RGB-25A (A= Atari)
Basically, an SC1435 is an EGA monitor with an odd connector,
so the Roland adapter is just a cable with a D-9 and a DIN-13.

Technically speaking a host adapter would be an interface that allows
you to connect a SCSI, IDE, MFM, RLL or whatever, to the DMA/ACSI port.
In that respect he does need a host adapter.

The MFM host adapter contained in a Megafile 20 is the only way I can
think of to connect an MFM drive right now.

Absolutely, but the display is so crispy. Much better than those 9" mac
displays for example.

There were descriptions on how to make the image 'full screen' by
changing a capacitor or something inside, but I remeber reading that it
was bad for the monitor. I also really don't like fiddling with voltages
like those you find inside a monitor.

The size is normal, and IIRC the image on my 124 was also not perfectly centered. Look at the back, there should be some potmeters there, you can center the image with one of them.

To use more of the screen you can do one of two things:

1. Open the monitor and adjust the borders. Not recommended!
2. If you have a ST then install LaceScan or OverScan. I installed LaceScan on my Mega ST today, and it works very well. I got 720x480 on a SM125 :-)

Yes. If the display was bigger you would get distortion due to the
tube curvature.

BUT .. this is not the whole story! If you are confident about what
you are doing you can adjust width and height from inside the monitor.
There are stories, probably true, that doing this will take a certain
bi-polar capacitor beyond its tolerance and give you breakdowns.

I have sold-on my SM124 now but I replaced the bi-polar with a pair of
caps. which were well up to the job. There is a FAQ about this
somewhere. The monitor was very reliable with increased display size
and I can't say the small edge distortion worried me a lot :-)

I am posting for a friend with an ICD Host Adapter on his ST and STe systems.

We have a new 525 meg SCSI tape backup unit and would like to make it work with the Atari. Cabling issues are not a problem and the drive is recognized by the host adapter, but we need software to support the mechanism.

I have been out of touch with the Atari world for some time and would appreciate referrals to pass along to him for this concern.

If we are successful, I also have a second 525 meg drive and two tapes to offer to anyone who wishes to purchase them for a PC or Atari.

thing you've been looking for, Something you might want & something New
to you! View Catalogs at: www.teleport.com/~bensmith/bscomputers.shtml.
And Jump to my FTP site linked to my Web Site so you can Download Free
Catalogs or FTP directly to: ftp.teleport.com/vendors/bensmith/ or if
you can't get Catalogs that way, Feel free to Request catalogs through
E-Mail. Really, it's no inconvenience. I do ask that you specify Atari
8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not
Snail (Postal) Mail. Please let me know if I can't attach files to your
E-Mail. I will get back to you after the weekend. Please Direct all
Replies Through E-Mail to: bensmith@teleport.com.

I'm looking to trade for these Items for my Atari. I'm looking for
CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien
vs Predator and even complete Jaguar Systems. If you have what I'm
looking for, check my Atari Catalogs for stuff to trade at:
http://www.teleport.com/~bensmith/bscomputers.shtml or
E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. Hardware
specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141
Monitor, Atari 1050 Disk Drives, Atari 1050 Happy Drive, Indus GT Smart

Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads,SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST & Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

TAPEBIOS and GTAR are the two programmes I used on my STE, and both are
free, produged a standard tar tape which could be read and written
under any of the UNIX systems.

I dug up a 1040 STf a while ago and finaly just got amouse for it. However, when I boot it, everything comes up fine but when I move the mouse it only moves vertically anf to the left. Even if I move it right, the mouse moves to the left! Eventually the cursor just gets stuck along the side left of the screen. What is doing this? Is it the ST or the Mouse? Is there a way I can fix this?
Replys much appreciated.

Yes it is normal, but it is changeable. I did this to ones I owned, and several others. There was a documentation file I saw a long time ago that told exactly how to do it. Basically you take the cover off and use a plastic screwdriver (preferably) to adjust 2 or 3 trimpots. Best of luck!

Well, a few days ago.. ;)
I fix the problem. That machine works well with SM124, RGB and VGA Monitors.

It was a very very smal part of copper. It short the cutten track between
the blue/green wire. First i can't found that.. :(

After 3 Days i take a oszi to trace the clock signals. Also a magnifying glass..
That was the point. Remove that fucking smal copper part and it works well.

Thank you four answering.

Regards, Robert

BTW: I add some tips to DOITF030 / nemesis part (english)

CyberSTrider is on the lookout for a programmer with Lattice C and Devpac skills. We are currently looking at a project which will probably take a month to materialise and 2 months to fully bring to market.

There is an urgent need for a programmer so do get in touch if you think you may be able to help.

More details about the project and renumeration from CyberSTrider, via email...

Oh dear :-)

Could be either/both.

Clean the mouse ball, clean the rollers against which the ball runs -
these are often gunged up with hard deposits which may take a smidgin
of alcohol to loosen. Check the continuity of wires from the mouse PCB
to the mouse plug. Try it out.

If no improvement you probably have the trouble caused by too much
plugging/unplugging of mouse - fractured solder joints between the
mouse socket and the ST PCB. To fix this you have to remove the ST PCB
completely from the case so you can get at the underside. Carefully
re-make the soldered joints taking care that you get no shorts between
them.

First off, I hate you, Mattias! :^) (CAN $27 for a TT, mumble, mumble, mumble...)

And Brian, you fool! I'm glad to hear that your machine felt as fast as the 233 MHz K6 under Linux, though.

I have a 48 MHz CaTTamaran-equipped TT with 10 meg ST RAM, 16 meg TT RAM (_must_ have for Linux), and a 1 meg Nova card. It _smokes_ (about 300% normal TT with Fast RAM, and that's with no NVDI)! I use a Quantum LPS340 for Atari software, a Floptical, a 128 meg Sony MO, an NEC 3X CD-Rom drive, NEC 4D monitor and I'm working on ScanX to get my Microtek E3 scanner going. All hard drives are external, because the TT power supply can't handle the CaTT, Nova, and maximum memory along with a hard drive. I want an Ethernet card, but I bet I'll have to hack a higher capacity power supply to use it.

I tried to use my Quantum LPS105 for my Linux partition and there's no way to get X and Linux installed. I hate to use anything but Quantums on my Ataris, but I plugged an old IBM 540 meg drive I had in for Linux, so now I have plenty of room. I believe the System Solutions install took about 120 megs for the basic install without upgrades.

IIRC, the PTC will work as a VGA monitor (there may even be a VGA/TT switch on the back). A standard VGA monitor gives you a big blank area to the right of the desktop, but works fine. The scanner you are missing is the Canon IX-12F 300 dpi monochrome/halftone scanner. I have one with the interface card if you're interested (it works particularly well with the SLM laser printer as a copy machine (_much_ faster than the E3/HP LJet4P combo I have now!)). E-mail this guy if you're interested in completing your set, he had a Canon for the PC for sale a while ago: aguba@aol.com.

Best Electronics might have an unpopulated TT Ram card, make sure you get the one that does both 4 and 16 megs. The nibble mode RAM is hard to get, though, so line up the RAM before the board. Brad at Best should be able to tell you the RAM specs. There are also a couple of third-party expansion cards that take standard 32 pin SIMMs, but I'm afraid I have no experience with them.

Good luck, oh! you already have good luck, humpf!

Dan

> Jo Even Skarstein
> <joska@nuts.edu>

A qualified "maybe". If your STF has an empty spot for the Blitter in the lower right corner of the motherboard, it will also have two pairs of solder pads to toggle 2/6 chip TOS. Your Mega almost certainly has these pads, look for them near the TOS chips. If you find the same type of pads in the 1040, remove the solder from the one machine, bridge the pads with solder in the other machine, and switch the chips. Should work fine.

Body handling: HTML body converted to readable text

FIRST THE SOFTWARE:

2. TRUEPAINT V 1.02 $19 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color.

5. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon).

6. MIDI QUEST 4.0 $25 (Synthesizer sound editor) I have file list, will send upon request. Works on Falcon also.

7. STALKER 3.04 $19 Get connected with this reliable terminal program up to VT 220. A wide range of setups. All Ataris. Interface with Steno (see Steno) excellent XYZ modem transfer module. Works as
a prog. and Acc!!

8. STENO 2.10 $19 Interfaces with Stalker: You can cut, copy and paste from one to the other. Also works like Prg or Acc; you can even run it as many times as you want and you will have the "copy and paste" option between them.

12. CRAWLY CRYPT collection V. 1 more public domain and shareware (evenFalcon). $10 . This CD rom can be read by a PC also, format compatible.

13. LDW power: excellent spreadsheet. $ 2.00 no manual original disk only. (all Ataris).

HARDWARE

15. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari $40. (has original PC software)

16. SCSI II to SCSI II 50 pin cable. Use it to attach your Falcon/TT to and external SCSI device: (The Jazz, a CD rom, etc.) 2 feet. $17.

Free stuff:
Modem 1200 internal PC
External floppy drive 1DD/no Power supply/cable. good case/mechanism.
Ultimate virus killer UKV 5.9

If interested send ZIP code to ask UPS for charges. I am willing to go down in the prices if you buy more than 2 items. For software with light weighted documentation, I can send it for $3.00 US priority mail.
(if you are in the US; I am willing to send abroad also) Regards, Phil.

Notice: This week, there was a major failure in my server and I lost several business files. Hence, if you see one of this items was in your mail request please do so again, I will give it preference.

Find Gemar. Diamond Back sucks. Gemar is fast and reliable with any SCSI streamer I've tried it with which includes DAT and several QIC 80 drives. Can't say the same for Diamond Back.

3614. CaTTamaran!!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-06 00:00:00 UTC
From: oskancke@online.no
Message-ID: <66cjke$8gu$1@o.online.no>
Source record: 14949

I've got two TT's with 4/16Mb ST/TT ram, one with a Crazy Dots upgraded to 15-bit colours. Now, I would like to put in a CaTTamaran into one of them, but know absolutely nothing about it. I therefor have the following questions about it;

1. I've heard that the CaTTamaran can't be used with some revisions of the TT motherboard. Which revisions will work and which will not.

2. Price and availability. And is this the ONLY TT accellerator?
If anyone out there have a CaTTamaran they would like to get rid of, mail me and let me know..

3. Is it hard to fit?

4. What TT-ram card is best to use with the CaTTamaran?

5. I understand that the CaTTamaran accellerates both the CPU and the TT-RAM bus to 48Mhz. True?

6. How much faster than a stock TT (with fast-ram) will a CaTT'ed TT be?
Benchmark results mailed to me would be most appreciated.. ;-)

And while I'm at this question asking, I also seek info about this Crazy Dots that I have. I bought this second TT a month ago and it had the Crazy Dots installed. I don't have any problems using it, but I think I've heard/read somewhere that it can be upgraded to 16/24-bit. Anyone know anything about this? If someone out there happend to have this upgrade for the Crazy Dots, mail me and I might just be interrested in bying it from you..

Thanks in advance...

: Mattias Hembruch <mghembru@tyrant.uwaterloo.ca> wrote:
: >Also had an SC124 or whatever, but I already have one of those. Is the PTC a
: >VGA monitor in disguise?

I believe so. You can connect any VGA monitor to a TT.

: >So, I quickly ftp'ed a disk driver (cbhd by Claus Brod) and transferred over
: >from my PC here at work via floppy. Running cbhd.tos locates the drive: it's
: >identified as a seagate 157N, I believe. That's about 48 megs or so? Anyway,

Yes, about 48MB.

: >drive errors. So, question 1) is this driver too new? I've ftp'ed the AHDI
: >5.04 drivers, would those be better? I assume the Atari ACSI->SCSI module
: >will work with most smaller sized SCSI drives if this one is hosed? What is
: >the best HD driver to use, in general, that's either cheap or free?

The driver isn't too new. AHDI 5 is old and generally considered to be
buggy and not worth the trouble. CBHD should be better, otherwise buy
HDDriver.

You should just repartition the disc and start from scratch. Remember to
check the disc for physical damage.

I've been able to make partitions up to 2GB, IIRC, although that was on a
Falcon. I'm not sure if there's some other limit on the TT.

You can put any size SCSI hard disc into a TT. I have an 850MB disc in
mine but you could put a larger one in if you wanted to.

: Anyway, here are the questions I'm left with: what are my options for
: networking to my PC via Linux? Obviously I _CAN_ install Linux in 50 megs,
: but the question is, how useful is it? Or am I just being wishful and Linux
: for the TT has never been around? Can a "dual-boot" be set up so I can boot
: Linux off one partition, and still keep a small Atari partition?

Yes you can use Linux/68k on the TT (there's even some simple GEM based
installation software for it) and I believe you can still use TOS. I
don't use Linux myself, though, so I can't comment further.

There are some networking devices for the TT but they're usually
expensive. The cheapest and slowest solution is to use a serial port at
115k2 (or 157k6 if your PC supports it, although I heard that you can even
use 230k4 but I haven't tried this).

: Right now I'm running the PCI1426 in TT medium resolution (640x480x16). Is
: this within spec? Seems to run just fine, and looks very nice.

Yes. Without a graphics card you can't get higher resolutions than that in
colour.

: Memory expansion: I'm already at 10 megs ST RAM, so I'm interested in
: TT-RAM. How can I increase TT-RAM? Which one does Linux use? I know some
: programs need ST RAM, and some will run in either. Is there a rule of thumb
: I can use?

No, the software should normally work in either ST RAM or TT RAM. Normally
you don't have to worry about which RAM the software uses. The only
exception for me is the Atari laser printer. In this case the page must be
drawn into ST RAM before printing.

You can add more TT RAM by obtaining a TT RAM board. The best way is to
get one that takes SIMMs. I've got an AixTT board in mine with 36MB of 72
pin SIMMs and it works very nicely. There's also a board called the MegTT,
and Best Electronics have it listed somewhat cheaper than the AixTT board,
IIRC. There are also others, including the original Atari TT RAM
boards, some of which are fixed sizes, others take 30 pin SIMMs.

This is normal, but it's easy to fix. Simply open the monitor and adjust
the size using the small trimpots present inside.

I have no idea why everyone is warning against this, I've done it on many
monitors and they're all still working perfectly! I've never heard of a
case where it caused any problems (maybe someone else has).

I don't know about the suggestion to change a capacitor, I've never heard
of this one.

How much for one of these?

I have a daughterboard, which seems to have 8 megs of ST-ram on it.. Does
that exclude the possibility of TT-RAM, or is that a different slot?

That's hard to believe, but then again, W95 is a brutal program.. Linux on
my P208 rocks.

True. IIRC, you need a rev H or higher to make it easy, but there are
some work-arounds for the older machines that may or may not work.

> 2. Price and availability. And is this the ONLY TT accellerator?

Availability: used market. They sold for around US$100 new, their
scarcity may add to that price. AFAIK, this is the only accelerator for
the TT.

> 3. Is it hard to fit?

See above, rev H is easiest.

Odd,

This may not be very helpful, but it was all I could come up with on
short notice:

You could run your TT under Magic and compare the first bench to a
Falcon in Gembench and compare your numbers to mine for a speed increase
percentage.

The second bench is my TT with CaTT, Magic and Nova in 256 color mode
(256 is faster than 16 on the Nova). This will give you good CPU
benchmark numbers straight away and a good comparison if you run Magic
and your Crazy Dots in 640X480X256 color on a standard TT (no NVDI).

How did you run TOS 4 on a TT? Thats the Falcon TOS (with DSP/videl routs etc)

Or perhaps you mean AES 4.x (4.0 or 4.1) under MiNT...

This is what you have to do to modify your Mega ST:

* Remove U12, to be found next to the spare ROM sockets. Instead of
removing this chip, it is possible to cut the +5V pin. I can't
remember which pin this is.
* Desolder W2 and W3, located next to U12. These 0-resistors are
connected between "pin" 2 and 3. Change this to "pin" 1 and 2.
* Find W4 which has no connection. Connect "pin" 1 to "pin" 2.

If this is done you can fit 6 TOS 1.04 EPROMS in the 6 ROM sockets.
The two chips fitted in your machine is probably TOS 1.02 in ROM
chips.

3624. HELP ME PLEASE: data-recovering from damaged floppy

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-07 00:00:00 UTC
From: thmerkle@aol.com
Message-ID: <19971207132601.IAA29664@ladder02.news.aol.com>
Source record: 14959

Hi folks!

is there anybody out there to help me or to give advice?
Problem: my dad gave me a DD-floppy-disk which refuses to operate (obviously damaged boot-sector). this disk contains data of many many hours/days/weeks of work, very important to him. as he's not really a computer pro, there's no backup existing, so he asked me (no comp. pro neither) for help.
does anybody have an idea what I could do to at least recover the data from the damaged disk? any idea about software-tools that could help and where to get them?

many many thanks in advance to You

Thomas

> connect the 'mono detect' pin, so that the ST will boot in colour.

First of all, 10x for the answer. But... such an answer I've found on the net many and many times, and still I have no any *working* scheme of connection.

Of course, I've found pinouts of SCART and Atari's 13pin DIN. I tried to connect them so
Scart Red - Atari Red
Scart blue - Atari blue
Scart Green - Atari green
Scart video input - Atari "general purpose output pin" (pin no.3)
Scart Red, blue and green GROUND - Atari ground

and I have many problems. When connecting grounds - I can't see anything at all
When not, I see constantly scrolling lines. And finally,
if instead of pin no.3 I use pin no.2 (Atari's Composite Video pin)
I can see the picture, but only at the moment I connect it in, after that a picture disappears.

So, what's wrong ? Does somebody have a *working* connection ST to TV ?
Please, if so, post or e-mail me info about how it is connected.
I don't think it's a TV problem, because it works properly as TV.
Any suggestions ?

Thank you in advance.

OK, but beware that some TV's requires resistors here, I used 33ohm resistors in the cable I made some years ago.

> Scart video input - Atari "general purpose output pin" (pin no.3)

No, it should be pin 2 - composite out. But if your Mega doesn't have a RF modulator it doesn't generate a composite video signal either. In that case just forget about this pin.

> So, what's wrong ? Does somebody have a *working* connection ST to TV ?

You have forgotten the sync-signals :-) Your TV can't make sense of the RGB-signals without the syncs. The ST has separate vertical- and horizontal syncs, while the TV has a composite sync. I used the composite video as sync, but as your Mega probably doesn't have this you'll have to generate your own composite sync from the vertical- and horisontal syncs:

```
Hsync ----|>|---+
+------- "composite" sync
Vsync ----|<|---+
```

Unfortunelately I can't remember which way the diodes are connected, so if it doesn't work the first time just swap them.

There was a program called Knife ST, which allowed you to
read and try to salvage data from damaged/correupt disks,
but I'm affraid I do not know where you will find a copy.

Yup ... the idea was that a one-inch object on the display would print
out as a one-inch object on paper. Really neat concept, but not
communicated too well by Atari Corp....

When this happens to me, I usually discover that the 9-pin connector
has started to come out from the mouse port on the bottom of the
computer. Push the connector in firmly and see if that fixes the
problem.

If not fixed, unplug the mouse from the computer, disassemble
your mouse (using a small phillips screwdriver), and verify the
continuity of the mouse wires with an ohmmeter. If one or more
wires is broken (i.e., high resistance in ohms), you need a new
mouse cable.

Linux needs atleast a 68030, so you'll need the PAK-boards.

> have experience with this procedure and can give me hints for doing the
> job properly? Thanks a lot in advance :-)

The 68010 is pin-compatible to the 68000, and is slightly (max. 10%) faster.
It should be a matter of just swapping the chips, but the speed-increase
is very small and you can't run Linux on it anyway.

But you will need TOS 2.06 because older versions of TOS does only support the
68000 processor.

The disk-format shouldn't be a problem, Atari uses PC-formatted disks.
You'd have to run an emulator with Signum to convert the text files
to ASCII though, or use a converter (does one exist?) or find someone
with an ST and Signum II (ahem, that migh actually be me...) to convert the
files for you.

From: willard@headwaters.com
Message-ID: <66h68s$ir4$1@newsbell.bellglobal.com>
Source record: 14974

Greetings all;

I've been trying to get an ST278R seagate drive to work in my megafile.

With both Atari's driver and HDDriver6 I loose date and have FAT collisions

Another drive mech I have works well - it is an ST138R which is supposed
to be 2,7 RLL. The 278R is JUST RLL according to the tables.

The megafile's card has just one 20 pin connector but has solder pads for
the second one. The card is 32D5321, C103168 Atari.

Will this 278R work in the Megafile?

I formatted using interleave 0, and defaults to 62.5 megs.

More info on request.

Willard.

I'd assume that you could do that by saving the files on the atari as ASCII
files
then put them on a floppy
into the pc it goes then open them up with word perfect????
does this sound logical????
i've not had to do that as I use both pc and st daily just need a network
between the two thats all

3642. Formatting my HD

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-08 00:00:00 UTC
From: Ben <bsilk@icrossroads.com>
Message-ID: <348BD966.24B9@icrossroads.com>
Source record: 14977

Still wondering how to format my HD... is there any good software out there that can help me? I tried HDX and Supra format but HDX doesn't seem to do anything while Supra needs to know EXACTLY what type of drive it is, with # of sectors, interleave, etc... all the stuff which I don't know.

Isn't there a simple program out there where you can just click on format and it does it?

3643. CDR on Falcons

Newsgroup: comp.sys.atari.st.tech

From: chrisc@zetnet.co.uk
Message-ID: <66hliv$g0s$2@roch.zetnet.co.uk>
Source record: 14978

Hi Folks,
Does anyone know of any CDR software for Falcon's. I know about CD Recorder Pro, and I need it's ability to multisession record data and audio (from .WAV and AVI). The basic problem is it costs almost as much as a CDR burner, and it only supports Phillips and Yamaha burners (that isn't such a problem really), andy info to me via email please....many thanks for any help...

chrisc

Here we go again.

Issue 51 of ICTARI is now available at the usual place:

http://www.elis.demon.co.uk/ictari/ictari.htm

For those who don't know, ICTARI is the monthly(ish) disk-zine
for Atari programmers at all levels. It also needs help in the
form of contributions to survive.

This one's actually quite good, there a couple of "scoops" in
the form of a letter about GEMMA from Paul Jones, it's creator,
and the Cadenza Address Book with full sources. Thanks to all
the folk with STOS WEB-sites, they were really useful for
answering the queries of our latest subscriber. Tell your
'net-disenfranchised friends.

Have Fun,
"Augeas"

Well if you want to wait Roger Burrows (ExtenDos) is working on a update
that will do CD-R recording and will be cheaper.

No details yet but this was posted on Genie with Roger's ok.

Regards,

Rich

Actually, you'll see he's running W95, to avoid running Linux (obvious
questions as to why would take too much space, so I've omitted them).

>I have a 48 MHz CaTTamaran-equipped TT with 10 meg ST RAM, 16 meg TT RAM

Where can an ethernet card be had? I can find a cheap $40 one for my PC, and
I'd love to have a localnet :-)

>Best Electronics might have an unpopulated TT Ram card, make sure you
>get the one that does both 4 and 16 megs. The nibble mode RAM is hard to
>get, though, so line up the RAM before the board. Brad at Best should be
>able to tell you the RAM specs. There are also a couple of third-party
>expansion cards that take standard 32 pin SIMMs, but I'm afraid I have
>no experience with them.

Well, that just sounds too expenive. Heck, I'm not going to shell out $200
for RAM when I paid $30 for the machine! I may have a lead on a bigger hard
drive, but I guess without more RAM, I might as well forget it.. Same with

the video card: 640x480 X11 is not that great, get video card, requires bigger monitor (unless the PTC1426 will do 800x600), etc.. Just too much money (I was thinking of almost getting completely out of the Atari world until I found this beast).

>Good luck, oh! you already have good luck, humpf!

Would you be happier if I sold my Mega4 cheap?

Mattias

Thanx a lot, you saved me a lot of bargaining and soldering for nothing. People may laugh but I�m not willing to give up my old machine easily that did not hang up in allits years half as much as the Intel junk in one week. Are there still any retailers left in Europe or did they shut down or switch to junk as all seem to be doing in Germany :-(? Do you know any European mail order dealers that still sell PAK boards (I read the last article about it in a German ST mag that vanished about 1 year ago) ?

Greetings

Matthias

'Atari 520ST' is a computer, not a file format. What program were these
files created with ? What's the file extension ?

Hi Tony,

I appreciate all the enthusiasm my site seems to have generated.
I'm currently weak in the arcade area so its just beginning to evolve
and I'm just beginning to make connections with people in regards to
un-released and in-house Atari arcade projects, expect to see images and
information on prototype and unreleased arcade equipment from Atari in
the near future, I apologize that there isn't anything mysterious and
exciting in that section as of yet, I hope you liked the rest of the
site, take care and happy holidays.

Curt

Message-ID: <01bd04d5$cb09bc80$059c41cf@pconstantinou.isdn.net>
Source record: 14989

I've got an Atari CX22 trackball that I bought for a C-64 several years ago that I would like to use with
my IBM compatible; it would be great for my kids to use rather than the difficult to grasp and
operate mouse.

Has anyone ever tried connecting the trackball to the PC serial port, and if so, are there any instructions or
drivers available to interface with it?

Please reply to me at adillon@icthomasson.com

Thanks for any and all help.

Phil Costantinou

b> anschlukabel!

Yes, Ruftrade leaves something to be desired at times! As a German speaker, I find it easier to translate from the original rather than a Ruftraded text! But in case you want to know, I have translated the remaining German words and incorrect English ones too below, though I have not corrected the syntax where the meaning is clear. When reading, omit the words in curly brackets {...}

Material:
1 34 {Poliges} way ribbon cable{(?)} about 30 cm long
1 20 {Poliges} way ribbon cable{(?)} about 25 cm long
1 V-cable for the {Stromversorgung} power connection
1 {Flachbandbuchse} IDC socket 34-{polig} way {to the aufquetschen}
to be pressed on
1 {Stiftleiste} plug 20-{polig}way to {the einl�ten} be soldered in

SH205 / Megafile 20

The modification as {at the top} previously described implement(ed), merely the resistance and the {strip conductor} track need not remove{s\}ed {i.e.. become durchgekratzt} or be scratched through. This {measure} procedure is merely required with the RLL-Controllern from the type Megafile 30/60 {required}. In the SH205 and Megafile 20 {will(_be)} a MFM-drive with ST412/506 BUS {needs} will be needed.

Megafile 30 / Megafile 60:

All cable to the hard drive {abschrauben} unscrew and then the disk {umdrehen} turn over. {If} When the disk is turn{s\}ed around, all

{messingfarbenen} brass-coloured {Schrauben} screws now {delete} remove and {on the} best {to a Magneten put} place on a magnet, then {rollen it not} they don't roll away. Now the disk again {umdrehen} turn over and the {Geh�usedeckel} housing lid {after at at the top abnehmen} remove upwards, then with {a Spitzzange} flat-nosed pliers {complete Blechlaschen geradebiegen the} bend straight all the tin tags and then the {Blechk�fig after} screening cage {at the top to wegnehmen} remove upwards. Now the two {Schrauben} screws of the mains adapter {rausdrehen} unscrew and to the {Magneten} magnet put, {following} next the {Netzteilkabel} PSU cable to the circuit board {rausziehen} pull out and then the mains adapter {rausnehmen} remove and aside put. Now lay the disk on its head again {to the head put} and unscrew the four {silbernen Schrauben} silver screws of the built in HD drive {Festplattenlaufwerks rausschrauben unscrew}. The hard drive keep hold of and {all} again {umdrehen} turn everything over, now the {Anschlu�kabel} connection cables to the disk remove and {weglegen} put away. The {silberne Schraube} silver screw that the small LED-circuit board to the {Frontseite} front side {held} holds must still be{come} remove{s\}ed, as well as the small {Schraube} screw {in the closeness of} near the {L�fters} fan {still is to remove}. Then can one the whole{(ly)} {Controllerplatine} controller PCB from the front {anheben} lift and after this from the front {wegziehen} pull away.

On the underside of the hard drive {locates\ed (self)} there is a resistance-Array, {(of)}this is{to} from the old (original) hard drive to be removed. On the new hard drive must a resistance-Array be available, {with it the Busabschlu� correct is ensures/ed} so that correct bus termination is ensured.

On the {Controllerplatine} controller PCB now clear the {L�tpunkte} solder points of J1 {with a Entl�tpumpe freilegen} with a desolder pump and {following} after this {the 20-polige Stiftleiste einl�ten} solder in the 20-way plug. Then unsolder R19 {to a page rausl�ten and wegbiegen} at one end and bend away or complete(ly) remove. On the underside {goes of}, from pin 18 a {strip conductor} track goes direct(ly) to a {through contacting to} via on the circuit board, this {strip conductor durchkratzen} track is to be scratched through.

Now insert the Controller again in the {Blech} screening cage {put} and place it in the case {put in}, then replace the present internal {available} hard drive {again put in} and {festschrauben} screw it fast, and don't forget the small {silberne Schraube} silver screw {in front of} near the {L�fter not forget} fan. Disassemble the 34-{polige Flachbandbuchse auseinanderbauen}way IDC connector and {circa 15 cm of the Platinenbuchse removes\ed draufquetschen} squeeze it onto the cable some 15 cm from the PCB socket. First push the new socket {now} onto the first disk {draufschieben}, then {the Platinenbuchse} push the PCB socket onto the plug {to the Stiftleiste draufdr�cken} and now push the {still free(ly)} 34polige} remaining 34-way socket onto the new, second hard drive {aufschieben}. Push the short 20-{polige}way ribbon cable{(?) to}

on the {Stiftleiste} plug marked {with the indication} J0 {aufstecken} and connect the other end to the first disk {aufstecken}. The new 20-{polige}way ribbon cable{(?)} should be connected to the {Stiftleiste with the indication} plug marked J1 {to} on the {Controllerplatine aufstecken} controller PCB and the other end to the 20-{poligen}way connection of the {Zweitplatte aufstecken} second drive. On the new {Zweitplatte} second drive, replug the Jumper {of} from DS0 to DS1 {umstecken}.

The {VKABEL} V-cable is to be connected to the {Stromkabel aufstecken, what of} power cable that comes from the circuit board {comes}, and then the two free{(ly) Abg&#65533;nge} ends to the {Stromversorgungsbuchsen} power supply sockets of both {every(one)} hard drives. {put. Ever\y after Abmessungen} Depending on the dimensions of the second drive this must still be screwed in place, but due to {(of)this still become befestigt, what through} the not standardised {Befestigungspunkte every self be left will(_be)} fixing points this will be left up to each user to work out for themselves. The fixing points {Befestigungspunkte} of Seagate and Nec {are right} actually {agree} coincide, however {have} the TEAC, Tandon - Western Digital disks {again other Einbaurahmen as\than too Befestigungen} have different adapter-frames as well as fixing points. It's therefore left to everyone to provide their own solution {stays from there every self be left, as it the removes}.

Then {can} the {mains adapter} power supply can be replaced and screwed down {again put and become festgeschraubt}. If you want to re-install the screening plate, you have to cut off a little at the front with tin-snips otherwise the screen will not fit afterwards. {Who the Abschirmblech again building in want, must with a Blechschere tothe Frontseite something abschneiden,other fitted the Blechabschirmung afterwards not more on it.}

In the Megafile 30/60 {will(_be)} a RLL-drive with ST412/506 BUS {needs} will be required.

If the hard drive({n}s) do/es not run up any more {hochf&#65533;hrt} and only a clicking or {pipes to vernehmen} whistling is to be heard and both LED's {to} at the Front{seite to it aufblitzen} blink, {is} either a short circuit is the cause or an overload {&#65533;berlastung} of the {mains adapter in the game} power supply.

Attention: The Atari harddrive driver AHDI supports{\ed (the same in what} (no matter which version) fundamental(ly) only {A} ONE hard drive {BY Ger&#65533;teaddresse} per device address. The only harddrive driver that supports {the} TWO hard drives {BY Ger&#65533;teadresse support} per device address are the CBHD (from the Scheibenkleister 2 book {oh sugar! 2)} and the HDDRIVER of Uwe Seimet (Uwe_Seimet@KA.MAUS.DE).

Regards
/Peter/

3657. Strange thing w/Supra 42M HD

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-09 00:00:00 UTC
From: cj439@FreeNet.Carleton.CA
Message-ID: <66kb90$5ju@freenet-news.carleton.ca>
Source record: 14992

I have a trusty ol' Supra HD (praises, praises, it's a wonderful little drive unit). The strange thing is, that I had it attached to an STfm, and set for SCSI 0, and it worked quite well. I brought home my 4Meg STe, and hooked it up, and the Supra wouldn't boot! Then I went against obvious logic, and changed the SCSI to 1, and it booted up normally! So, SCSI 0 with older TOS(1.04), and SCSI 1 with TOS 1.06. Funny, eh?

You can't use Linux on a 68010 CPU. 68020 does the job, but only if you add
a 68851 PMMU.

Cheers Peter

Let me know if you decide to get out again, especially if the TT goes
cheap!

Dan

BTW, I hear the 8 meg ST RAM daughter board is worth quite a bit. Maybe
you could trade the 8 meg card for a 2 meg ST card and 4 or 16 meg card
of TT RAM.

If Word Perfect can handle RTF files, and the files you want to convert are a common ST word processor format, ie 1st Word plus, you can use Marcel to convert them to RTF, then have WP import the results. That way you keep all, or most of, the formatting info.

> is very small and you can't run Linux on it anyway.

Also, for those who are contemplating using an '010 in place of the 68k:
you may need an OS upgrade: the 68010 (and later CPUs) have a different
stack frame format to the 68000 (and it's cut-down "budget" model: 68008)

Earlier TOS versions are ignorant of this difference, and will either be
very confused, or misbehave (often fatally).

3664. New ST Owner

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-10 00:00:00 UTC
From: Liam Busey <liam1@ix.netcom.com>
Message-ID: <348EC401.4691@ix.netcom.com>
Source record: 14849

Hello everyone, I just got an Atari 520STFM and am quite impressed with it. I read the quik FAQ but I still have a few questions.

Is it normal to have to press the reset button in order to boot after turning the machine on ? If not do you have any ideas on what's to blame? When I recieved the system, I had to strip it down to it's motherboard and press down on it's chips to make it work. Could I have damaged something in the process?

I only have about a 1/2meg of ram. Are there any user stupid kits to upgrade this machine's memory which don't require expertise with a soddering iron. BTW, this model isn't equipped with sim slots.

I'm not sure where the rom containing TOS is located on my system. I've heard that it's either located on two or six socketed chips depending on the model of the machine. I have areas of my motherboard that contain both two and six chips. One's under the power supply(6), the other is near the joystick/mouse ports (2). Which one is the rom?

```
1111111111111111111111111111111111111111
1 ! ! ! 1 1 ! ! ! 1
1 6 chips 1
1 1
1 ! 1
1 ! 1
1 2 chips 1
1111111111111111111111111111111111111111
```

My 520 STFM is fairly pathetic in comparison to Falcon 30es and TTes. Will I be able to run most software designed for the ST line of computers?

Well, that's enough questions for now. I'd appreciate any help you could give me.

Thanks,
Liam Busey

I have no familiarity with Signum, as my Word processor is Calligrapher
(I'm happy with it). I transfer files from Calligrapher to Word 6 using
export files as Rich Text Format (RTF). This transfers all WP control
codes, and little is lose. Can Signum save files in RTF format?

Can anyone help this person who doesn't have usenet access please?

I'd appreciate an email to me on derryck@cix.co.uk as usenet access isn't always 100% I'm afraid.

I'm having a real battle trying to get this here Mega 4 working

I'm positive it's a memory problem unfortunatly it's got 32 memory chips soldered directly to the motherboard REV 4.

The damm thing runs Auto Programs and most Games fine
but initalizing GEM causes an 8 Bomb crash.
I've tried a number RAM checkers from the auto folder
without luck (some need GEM)

Does anybody know which chip numbers are allocated to each memory bank and which half of the data bus (Hi/Lo)

Thanks in advance.

Speak to 'ya later!

3670. Commodor 1084 monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-10 00:00:00 UTC
From: Leo Ragot <dbs639@freenet.mb.ca>
Message-ID: <66ve7v$g9$1@postern.mbnet.mb.ca>
Source record: 14855

I recently purchased a Commodore 1084 RGB monitor and would like to know if it can be used with a towerized F030 or Mega 4 ST. Because of the way the Falcon's board is positioned in the tower, the RF modulator can't be easily accessed and I don't want to do any damage to it. Anyway, the monitor has the A/V inputs in the back and has two DIN ports labelled "TTL RGB" and "LGA." I have used the monitor to watch movies [hooked up to a VCR].

Thanx in advance for any help directed my way.

Leo Ragot, STUG [ST Users Group of Winnipeg]

You get warned against this mostly because very few of you out there are educated in high voltage and electronics enough to know better than to stick you hands into a live monitor!!!! Your monitor generates more high voltage due to the coil inside than your whole house uses combined for other appliances. Youll get to those pearly gates rather early by getting knocked clean on your ass(that is if you havent burnt it off in the process!!!!) if you use incorrect tools. You do not want to use a metal screwdriver, most professionals use purely plastic tuner tools to adjust tv's and monitors and this is ONLY WHEN TURNED OFF!!!!!! these stupid atari docs require that you have the monitor on and this is just DUMB FUCK STUPID IMHO. figures that an atari hacker came up with this.

This is strange. It might be some auto folder or accessory problem. Does
this happen when you boot from an absolutely clean disk ?

> I only have about a 1/2meg of ram. Are there any user stupid kits to

>

Yes, there are upgrade boards, but they all require a little soldering.
The Magnum even allows you to get 14 megs.

> I'm not sure where the rom containing TOS is located on my system. I've

Definitely under the power supply. If it were a 2 chhip version, you
would still have 6 socket, though 4 empty.

> My 520 STFM is fairly pathetic in comparison to Falcon 30es and TTes.
> Will I be able to run most software designed for the ST line of
> computers?
>

Yes, most games and stuff will run. Anything that is not Falcon specific
should run unless stated otherwise.

> codes, and little is lose. Can Signum save files in RTF format?

Hi,
Signum II can't save in rtf. The best way we have found is:
1- save all images out of the file and convert them in a pc format
(gemview for example),
2- replace all "stranges" caracters (for example in french all letters
with accent) by a combinaison of caracters never used (I used | for ?,
|| for ?, ||| for ?, ...),
3- save the file in ascii format; you loose the format of the pages.
4- import your ascii file in word and replace the "stranges" caracters,
5- save your file.
Good luck.

One possibility is the two driver chips next to the RAM, the 74AS373's.
The ones Atari used are not very good quality and need to be replaced,
preferably with a lower power version like the 74LS373. These chips can
cause weird problems with the cartridge port also. (Dave Small was the
first one to discover this problem with his Mac emulator cart.)

The chips are cheap, so replacing them certainly can't do any harm.

I have an STE with one meg of memory and was recently given two
1-meg SIMM's. I seem to recall that there is some way to install
these in my computer to achieve a total memory size of 2.5 megs.

Slots are in alternate pairs. Either 0/1/0/1 or 1/0/1/0 (not sure).
Bank 0 must have a larger size than Bank 1.

However, SIMMs (including 30-pin) are about $7 CAD per meg, so you
might as well locate 2 more and put the full 4 Meg upgrade.

There are no DIP switches or anything to change otherwise, afair.

Hi. A friend of mine is only using a Pentium with Win95.
He has some files I need, but his 520ST system is no longer working.
He tried reading the disk with Win95 but got errors(obviously).
Is there a PC program to allow ST disks to be read and copied
without altering the boot sector first?

It's simply not convenient to have him mail me the disk.
Thanks.

3680. [falcon} CAF/ADAT interface issue..

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-11 00:00:00 UTC
From: Mark Fassett <mark_fassett@intuit.com>
Message-ID: <3490694C.AD023134@intuit.com>
Source record: 14865
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings...

I purchased a SoundPool ADAT interface to go with my Falcon and Korg 168rc digital mixer. I use CAF 2.06, HDDriver 5.10, ScreenBlaster 2, SoundPool's new FDI init, CAFfix, and that's it in the Auto folder. I have the old Steinberg FDI, upgraded with SoundPool's kit for 20bit capability.

The problem: When I'm recording to the ADAT interface of the Falcon, for some reason the outputs of the Falcon switch to use the wrong ADAT output channel. When I reboot, the outputs are always correct, but then as I record more tracks, an instrument that is assigned to, say, channel 3 playback on the Falcon's arrange page will move to channel 4, then 5, etc, randomly (in other words, a track assigned to the Falcon's audio track 3 will play back, and have volume in the mixermap controlled by, the wrong fader.. the one for track 4, for example)..

If I'm just playing back a session, the outputs seem to stay correct.. it seems to only happen when recording.

Does anyone know what the problem might be? Has anyone else had this problem?

Once I get this solved, my system will be perfect.. the combo of CAF, ADAT interface, and Korg mixer is killer for the Falcon user. So any help will be greatly appreciated.

3681. Need Batch download OR good disk Backup util!

Hi,

I just installed the Gemulator on my PC, and have a mountain of files to move. Unfortunately, I have

a big 350Meg drive on the ST which was formatted using ICD software, so the PC couldn't read it
even if I had a SCSI card (Which I don't). I was hoping to move large segments of the drive with my
old TURTLE (v.2.17) backup utility, but it doesn't work right since the drive was formatted with the
ICD package. The next best thing would be to just batch upload folders at 19.2 K baud, and let it
cook overnight. Ideally, a "Laplink" for the ST. Is there anything like this out there? Hopefully
PD? If not, a good disk backup utility that can recurse sub directories, and doesn't crash all the
time
would be the next best thing. Ideas?

If I remember correctly, PC Ditto (a pc emulator for ST) had a driver
that allowed DOS to read ST-formatted disks (before they really became
DOS-compatible). The driver was called pc_ddrvr.sys and should be put in
the config.sys file. It installs a new drive that accesses the A:-drive
with its own routines. I'm not sure if it will work with Windows 95, but
you can boot with DOS of course.
I think I still have it somewhere.

3686. Upgrading a 520STM+

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-12 00:00:00 UTC
From: "Adrian St. John" <adrian@realobj.co.uk>
Message-ID: <534646386wnr@realobj.co.uk>
Source record: 14871

Hi,

I own a 520STM+ (ie modulator & 1Mb upgrade) and want to upgrade a few things.

Firstly, I've been given a 150Mb SCSI drive. Does anyone know if this can be hooked up to the (internal) SCSI connector on a SH204?
I have no problems messing about with the internals of that thing (I've already 'upgraded' it to a 40Mb drive).

Also, if I can hook it up, can I get around the stupid 16Mb partition limit I have at the moment?

Secondly, does anyone know how to put more memory into the thing? The 1Mb upgrade (if I remember correctly) uses a daughterboard and a soldered-on connection to (I think) the video chip (may have been the MFP though). - its been a few years since I looked at the internals of it.

Thirdly, what are the options for increasing the processor speed?

Thanks in advance,

Adrian.

He most likely will have to send the disks to you. Unless the
floppies were made with TOS 1.04 or greater PCs can not read them.
Also PCs can not read twisted disks.

Brian

What kind of drive is it? Manufacturer name and model number would be needed to identify the type of SCSI (most likely is SCSI-1 though). Keep in mind, the Atari controllers were notorious for being 'very' picky about the drives it could talk to.

>Also, if I can hook it up, can I get around the stupid 16Mb partition
>limit I have at the moment?

If memory serves, that's a TOS limitation. You would need to get TOS 1.4 (Rainbow TOS) and may also want to get ICD SCSI-Pro or HDDriver.

>Secondly, does anyone know how to put more memory into the thing? The

There were a few 2.5 MB upgrades for the the 520 ST, check the dealer web pages.

>Thirdly, what are the options for increasing the processor speed?

There were some 16 MHz upgrades, don't know if they were compatible with the 520 ST though.

You may be better off looking for a Mega STe with 4 MB RAM instead of trying to tweak your 520 ST. IMHO

Bud

I would like this information as well since I have an SH204. I believe
the 204 information is in the FAQ area, and says something like this.
Adsci to SCSI to MFM, which had me thinking you could pretty much drop in
a SCSI drive and omit the mfm adapter. Of course I don't really know, I am asking
the same as you. I do know that the 204 is different than the megafiles.

What version of TOS do you have? Newer versions allow greater than 16mb. After
that I believe you need the special driver software, of which there are a
few to choose from.
>Secondly, does anyone know how to put more memory into the thing? The

>it.
I would imagine, that you are stuck with 1meg on that particular board.
Mine is a daughter board that support 1meg and 2.5 meg configurations.
There are 2.5meg boards advertised on B&C computers homepage. However
this is in the United States, Far enough away from me let alone you.

>Thirdly, what are the options for increasing the processor speed?

Ok, I just got back into my ST recently so I am sure you will here of
newer and better things. There was the ICD 16mhz 68000, as well there was
a Tiny turbo 25mhz and a Fast Tech 25mhz. B&C has some of these as well.
There was also a Canadian one at 16mhz which I am not familar with.
I have read of installing the newer TOS and plugging in 68020s etc.
Since my computer is in a similar state as yours, I am considering the same
upgrades. For reliability, I hope you get replies from people that actually
used these.

The other upgrade which I am considering is called a FALCON:-)

PS. I haven't followed Atari since 1992, can anyone tell me what ever happened
to Dave Small, the GCR stuff and his 030 boards?

You don't say whats wrong with the 520? Could be something that the six
inch drop fix could cure. Or even more conservative, pressing the chips in
securely. Obviously if its working, your troubles will be gone. Just an
idea.

True enough

Now on the topic of PC and ST disk transferral. I have a question.

SHould I drag some BMP pictures or any other file off a windows 95 desktop
and copy them to 720K disk, a unique thing happens that I haven't seen
before. On my ST the 720k disk shows extra, corrupted? files and the file
I took from Windows 95. Generally it reads it as per normal and I can use and
copy the file I wanted. However IF I tried to update the disk, ie hit the
escape key, it is sent into instant confusion, like when one has a corrupted
disk. This shows up on all 5 of my ST's but not on my STe. The ST e does not
show the corrupted data. These files cannot be removed from the floppy by the
desktop. I use a prg called Universal Item Selector III that shows that the
files on the ST are hidden and write protected. I then can trash them from
the file selector.

For some reason these hidden files that windoze 95 writes, do not show up
on my STe and do not affect disk updates. Regardless I now remove the
hidden files.

Is it just me, or is there something different happening with Windows 95
than say with 3.1 and Dos, which don't seem to created the extra unwanted

information?

520ST Tos 1.0, SH204, 2.5meg ram.

>None of my programs will read it.

Rename the extender to IFF. The JML-Snap 3.10 demo bundled with my Nova card saves in that format. You need to be running in 8-bit color mode or less for it to work: snapshots attempted in high- or true-color modes will not work correctly (all pixels end up black). JML-Snap can't save them in anything higher than 256 colors (at least the demo can't, although it's more a limitation of the older IFF format).

Use Imagecopy for snapshots, since it supports all but one of TIFF's many LZW-compressed bit-levels, creating small, efficient files that exactly match the Nova's current screen resolution.

>cause weird problems with the cartridge port also. (Dave Small was the
>first one to discover this problem with his Mac emulator cart.)
Yes, I did mine years ago. If the RAM buffer chips are made by SGS then
definitely replace them. I replaced the T74LS373B1 chips with 74LS373 chips
and did the T74LS244B1 chips with 74LS244 at the same time.
It made the Mega ST much more stable.

3697. Using an SM124 monitor with a PC

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-13 00:00:00 UTC
From: news@wiziwig.demon.co.uk
Message-ID: <3492a7be.8002301@news.demon.co.uk>
Source record: 14882

Does anyone know how to wire up an adaptor to enable an SM124 monitor to be used with a PC? I remember reading a few years ago that it was possible because an SM124 is internally the same as a VGA monitor. Is this correct?

I have memories of a book which I think was called Your Second ST Manual, and which was excellent. However, I can find nothing about it now. However, I think this book explained how it could be done.

Any answers are much appreciated.

I use twisted discs as standard and Win95 reads them with no problems. Not only that, but it seems to handle discs that were formatted 8 years ago under TOS 1.0!

It seems as though Win95 is a bit more sensible about disc handling and reads the boot sector to work out the disc format. I could be mistaken but that is how it seems to be.

This happens to me but not all the time. I haven't figured out why yet.

Its probably a result of when CAF was upgraded to support the ADAT interface.
Steinberg said they and some problems when the added ADAT interface support.
At least thats what I recall I heard.

I have an Atari STE 1040 with 4MEGS of RAM, 80MEG hard drive and would love to put my system on eithernet. I'm running Category 5, RJ45 connectors to a HUB and a NT 4.0 server.

Where do you get eithernet cards for Atari?
Where do I get the proper software for the Atari to see the LAN?
If this stuff exsists, could the LAN see the Atari?

If the suggestions are to use the modem, I do not want to go that way but, I appreciate that method.

Thank you for all the advice given to me, now and in the past too!

Very likely the 2 chips you noticed are the Midi- and the keyboard-ACIAs.
Check out if they got 6850 imprinted.

There never have been 520 STs with the 2 chips ROM version.

It's not very advisable to replace AS type TTL by LS type, as the latter
is significantly slower !

Unlikely the 150MB drive would cause much problems. Some drives have parity
enabled, you normally need to change a jumper then to switch it off.

> Also, if I can hook it up, can I get around the stupid 16Mb partition
> limit I have at the moment?

Use a modern HD driver that can handle BGM or XGM partitions. Of course
you need a special program for partitioning too, the tools that came with
the SH drive don't do that.

Those are significantly more complex work for which I do not have any step-
by-step explanations at hand. So you might consider some commercial solution,
but I don't know which are available for the ST.

A Macintosh does something similar when you put a PC disk in - it
creates trillions of 'hidden' files and folders which are perfectly
visible on an ST. Windows 95 BC isn't so bad - at least it can read
(most) ST disks - a Mac just takes one look at one and claims it's
unformatted.

Not at all. If it is possible then only by very careful programming of the
VGA card, which most drivers won't allow.

I haven't done any raytracing in more than 2 years. I gave up since I wasn't willing to wait for 10-15 hours for a scene to render. If the info is available, I'd be more than interested to have a look. I might even have another go at raytracing again.

The extra files are probably the ones used by Win95 as the long filenames.
They start with a 'A' and then use the next 10 chars in a letter-space
format. They seem to be marked as volume-names and have a length of -1
bytes. If you wipe them out, all it means is that when you copy them back,
they'll keep the name you used on the ST, rather than what Windows called
them. BTW, if you use Magic v5, it produces exactly the same format names if
you are using VFAT to enable long names.

I think the 256 colour limitation is related more to the program than the
IFF format itself. IFF is quite capable of storing any number of colours
since it splits the image up into bit-planes. This does mean that if
compression is on, it doesn't squeeze the image very well. Not that it
could anyway, since it uses RLE compression.

I wouldn't use it for more than 256 colours because of this. In fact, I much
prefer to use GIF for <=256 colours since it usually compresses much better
than TIFF with such a limited number of colours.

Yes, I do know that IFF supports up to 24-bit color. Cranach even saves in a 12-bit flavor of the format. From my experience with the ST, IFFs greater than 8-bit are rare.

>I wouldn't use it for more than 256 colours because of this. In fact, I much
>prefer to use GIF for <=256 colours since it usually compresses much better
>than TIFF with such a limited number of colours.

An LZW-compressed TIFF would be close to the size of an equivalent GIF, since both are sharing the same compression scheme. For <=256 colors, an LZW TIFF -- as you know -- has to be either 4- or 8-bit, whereas GIF, of course, supports all the lower bit-levels. If a screengrab is saved in 8-bit LZW TIFF format and it only contains, let's say, 64 colors, then that TIFF will not compress quite as well as the 6-bit GIF version (no extra overhead in the palette). But you're right -- GIF is the better format... but marginally for screengrabs since most Atari video modes are either 4- or 8-bit anyway. And many people, especially on the Web, don't optimize their GIFs to match the actual number of colors in use. It's like seeing an 8-bit GIF with only two colors -- all that extra overhead bytes-wise.

For those rare screengrabs where more than 256 colors are needed, LZW TIFF is the format to use because it directly supports many video modes (12-, 15-, 16-, 18-, 21-, and 24-bit). From there, a 24-bit PNG conversion wouldn't hurt <g>.

> I took from Windows 95.

These extra files are caused by Win95 using VFAT to store long filenames. These files contain the extended information about the files (greater than 8.3 name etc.)

> Generally it reads it as per normal and I can use and

> escape key, it is sent into instant confusion, like when one has a corrupted
> disk. This shows up on all 5 of my ST's but not on my STe. The ST e does not
> show the corrupted data.

The settings of the date and other flags are set to invalid values IIRC, (so that VFAT can identify them) which is why the Atari behaves strangely. I guess Atari re-wrote some of the directory parsing routines for the STe, as this is behaving differently.

> These files cannot be removed from the floppy by the
> desktop. I use a prg called Universal Item Selector III that shows that the
> files on the ST are hidden and write protected. I then can trash them from
> the file selector.

If you trash them, you loose the long-filenames under Win95. However, if you are adding other data to the disk, you should delete the files as win95 doesn't like it too much (scandisk says errors) when there are some files that are not listed in the VFAT directory.

> Is it just me, or is there something different happening with Windows 95
> than say with 3.1 and Dos, which don't seem to created the extra unwanted
> information?

Its quite useful, actually...

Magic supports VFAT, as does a util by Sven Karlsson (complete with source) to copy files from VFAT floppies to a minix-partition under MiNT without loosing the long names.

I used a 1084 on my Falcon for quite a while until it my kid nabbed it
for his Jaguar:). I wish I could give you the pin outs I finally came
up with, but that info is long gone from my notes. If you take off the
back cover, you can at least find the "RGB pin out, and play around to
find the H and V sync. It is a great monitor for the Falcon "RGB"
mode.

I've had a customer with other problems with the ADAT-interface, which might be related to the same thing. I got a tip from SoundPool about adjusting a trim-pot inside of the ADAT-interface and that did the trick! Try it out and if you don't succeed, contact them soundpool@compuserve.com and you'll find that they're very helpful :)

I have posted something on this before but I see that you probably missed my posting on this subject.

There is a marked difference between Win95 and older windows/DOS on how it saves files. To cut the story short : the extra filename entries are used by Win95 to store long file names (LFN). Each of this entries stores up to 13 characters of the LFN. It is probably encoded in unicode but you can probably make out the entire LFN. They are marked as volume name, hidden, system and read only. They are purposely done so to be as an invalid entry - volume name cannot be a system file. It is done so that older version of MSDOS (that's 5.0 to MS) will not interfere with them.

On my F030, they do not show up. You can see the above mentioned entries using a sector editor. Older version of TOS may have problem reading them and righly noticed by you, may confuse poor old TOS.

The LFN option can be disabled on Win95.

>
> Ok, if you got an STE or Falcon ;-) I haven't.

Then it will ofcourse not work. Anyway, has anyone tried this? It could
be
interresting and it would also mean that we could connect alot of nice
stuff
like those Conectix ColourCams and also pocket ethernet adapters for
PCs.

Can some MiNT guru tell me why MiNT needs about 700k of free RAM to
do a fork? It doesn't matter how big the program being launched,
I always get a "fork: out of memory" error when I have less than
700k of free memory left. Very annoying...
Thanks,

>He tried reading the disk with Win95 but got errors(obviously).
>Is there a PC program to allow ST disks to be read and copied
>without altering the boot sector first?

David,

If they are a standard format, 720K, and made with an early version of
TOS then there are two bytes in the wrong order which stops the PC from
being able to read it.

There is a simple DOS utility called st2dos.exe which just changes these
bytes over. I have used it many times and so far it's always worked on
my old or PD floppies.

It is not guaranteed to work on every disk, especially those formatted
oversize so you take your chances but as I say it has helped my out on
many occasions.

Try an Archie or WWW search or if you get stuck let me know and I could
file-attach a UU copy and mail it to you.

beST wishes JayCee

From: Ross Sweetzir <rsweetzir@pmhab.ab.ca>
Message-ID: <34955A76.6496EBC9@pmhab.ab.ca>
Source record: 14656

I have aquired an Atari 520 STfm. I am intereseded in using it in my midi configuration however I was wondering if there is any way to increase the RAM in the box via DRAM chips. There are two banks in this unit on is soldered to the motherboard and the other is socketed DIPPS. What type of chips do I need to increase the memory in this unit to the maximum allowed, and what is that maximum? Do I have to install the chips in the soldered bank as well?

If i want to use a hard disk with this unit what is required. I have been confused with the abundance of different solutions out there. Is there a scsi adaptor, ide adaptor or mfm/rll adaptor out there for a reasonable price, or a design for one that can be made at home?

please be gentle, and if anyone knows a location fo the ST faq, or has a copy could you please forward it to me.

Ross

3722. Background DMA on STe?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-15 00:00:00 UTC
From: outrider@anv.net
Message-ID: <673nmt$4p4$1@usenet11.supernews.com>
Source record: 14657

I just recently bought HD Driver 7.04, and while my Falcon is getting Nemesised, I'm using it on my 1040STe with MagiC 5.11.

Is background DMA supposed to work with this combo? From what I've read in the docs of both packages it should. However, if I have it turned on, occasionally my system 'goes to sleep' during a read, for anywhere from a few seconds to close to a minute, and then it comes back to life. LED Panel's read LED stays lit the entire time. It doesn't seem to cause a problem, other than the annoying delay.

I didn't have this problem on my Falcon. (Of course, I wasn't using SCSI very much, either.)

BTW, I'm using an ICD ADSCSI+ host adapter.

Also, can I have Floppy Background DMA turned on in MagiC, even with background DMA turned off in HD Driver, or is that asking for trouble?

p> to move. Unfortunately, I have

p> cook overnight. Ideally, a "Laplink" for the ST. Is there anything like
p> this out there? Hopefully PD?

You can either link the serial ports of the computers together and use a program called Ghostlink to transfer the files over, or you can link the parallel (printer) ports together and use one of a couple of progs to transfer the files over, the best one for your purpose is called Paralink I think as all you need do is tag the files or directories that you want to copy and off it goes.

The parallel port is faster than the serial port but you will have to get a modified printer lead, I bought a cheap cable from a computer fair and just had to swop two wires over, full instructions are in the archive (just wish that I could remember the URL but it shouldn't be hard to find).

Just make sure that you can open one of the plugs as most are moulded.

Speak to 'ya later!

If not, a good disk backup utility that can recurse sub directories,

Hallvard, it is actually a printed article in the German Atari-magazine "ST-COMPUTER/ATARI-INSIDE". There's no text-file available at the moment.
I never thought there would be so much interest in this upgrade. I could ask someone from this magazine if I could use the text for a textfile. There are also some graphics in there, so it's all a matter of copyrights I think.
Anyway, if someone wants a copy of the article, please contact me directly.

(not the guy with the real problem) but Yes the pot can be adjusted til
a clean signal is heard. Also I had one of the early ADAT interfaces
and it required some work which the folks at SoundPool fixed. It was only a
two week turn around and thats from the US to Germany.

Yes, this works. Note that all the DMA drivers you're using have to
support background DMA. So this also applies to CDROM drivers for
example. Otherwise you must not use background DMA at all.

> back to life. LED Panel's read LED stays lit the entire time. It

Be careful with LEDPANEL. It doesn't properly handle physical disk
access or access to partitions beyond P:.

What drivers support background DMA? I'm currently using ExtenDOS
Pro 2.4a.

I'm not sure what you mean by physical disk access, and I'm not using
any partitions >P.

What sort of problems could LED Panel cause?

Thanks!

I don't think there are many programs that can handle IFFs with more than
12-bit colour. The IFF module for GemView can't, and it has failed when
trying to unpack a 6-bit. It handles 1-, 2-, 4-, 8- and 12-bit, but doesn't
seem to handle anything else.

> bytes-wise.

I think a lot of the extra filesize is probably the header of TIFFs, there
always seems to be lots of stuff included that just isn't needed. If it
wasn't there, then there wouldn't be any real size difference.

Since I use an STE, I try to keep the colours in GIFs to a maximum of 16
colours for the web. In fact the ones I create myself, rather than those
from other sources, are usually created with 4 colours and have a small
filesize. Any others that are freely available, I try to reduce down to 16
colours, just for those that do browse with STs

> For those rare screengrabs where more than 256 colors are needed, LZW TIFF is
> the format to use because it directly supports many video modes (12-, 15-, 16-,

> 18-, 21-, and 24-bit). From there, a 24-bit PNG conversion wouldn't hurt <g>.

I wouldn't mind being able to use the PNG format, but I haven't found any programs that support it and work on an STE. There is a module for GemView, both for saving and loading, but it needs a 030 or better. If you know of any conversion utilities that work on an STE, do let me know.

> useful with them:-).

You cannot run Unix on Atari STs. Unix requires virtual memory which in turn
needs a PMMU. So for STs you'd need to put in a 68030 or a 68020 in conjunction
with a 68851. You can run Linux68k on TTs or Falcons however, as those got
a 68030 CPU.

If you're satisfied with a Unix-like setup, you can install KGMD or KEMD.

There are quite a few BBS packages available for ST(E). Most major BBS or
ftp server should have them.

Cheers Peter

SPIN! by Julian Reschke or Steffen Engel's CDROM XFS.

> I'm not sure what you mean by physical disk access, and I'm not using
> any partitions >P.

Physical access is the mode to access a harddisk with absolute sector
numers, i. e. not on a partition basis but regarding the disk as a
whole. This is necessary for most harddisk tools and is also used when
installing hard disk drivers.

> What sort of problems could LED Panel cause?

I didn't want to check what exactly can happen. But it displays wrong
drive numbers in such a case and might even crash.

Concerning background DMA for your harddisk it is always active if you
have enabled this mode in HDDRIVER. If you didn't, it's not active.

3745. MintNET: the troubles continue...

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-17 00:00:00 UTC
From: s970707@uia.ac.be
Message-ID: <ELC8C4.7pJ@uia.ua.ac.be>
Source record: 14680

Hi everyone !

I'm still trying to turn my Falcon030 into an http server. I thought I had overcome the worst troubles blocking the installation of MintNet, but I was too optimistic... Anyway, I have finally installed Mint v1.12 with MinixFS and it works fine with the Syquest 555 Removable Hard Disk. I'v also installed all the very basic tools (ls, cp, chmod etc.). The GNU tools were the only ones that worked fine with Minix. Now, in order to install MintNet, I still have several questions :

* I prefer to use Korn Shell, but my Mint has the strange habit to start all processes in the background, e.g. when I launch top, top is started, goes to the background (running) and my prompt shows up in the foreground. This is a really nasty unwanted feature. I would like to continue to use ksh. My current ksh is Korn Shell v4.0a by Guy Gascoigne. Now, someone in this group told me this could be a Mint fork() problem and suggested to install a newer version of Mint. Fine with me, but where the dev*l am I supposed to get it ?
* I have downloaded MintNet from src.doc.ic.ac.uk (PL 40 I believe) and attempted to install it (from the init shell). This package contained an installation script and a found out that I also needed sh in order to run the script. So, I installed some sh from the Net, ran the script and boom : the installation started to complain for files it needed and were not available. So I checked and found out that those files were NOT in the MintNet Package ! My question : what's needed to install MintNet on top of my Mint, where can I get it, and what version/PL do I need ?
* Is there any simple but reliable editor for Mint. Something like pico would be just fine. I tried jove, but it had the strange habit to use CR end-of-lines, wich confused the hell of init, and made it unable for me to login (which is very unpleasant in a multi-user setup).

Thanks anyway,

Actually, we were talking about floppy background DMA. MagiC doesn't
even mention hard disk background DMA. (Ironically, HD Driver
doesn't mention floppy background DMA.)

HD Driver has its own switch for hard disk background DMA, whereas
MagiC has its own switch for floppy background DMA. The question is,
do these switches have anything to do with each other?

In addition to what Peter says, I'd like to add that it is possible (I've run an SM124 from a Crazy Dots card, which is essentially a multisync output) but you do need to get very close to the specs of the monitor by controlling the signal going to it in software.

Furthermore, it needs a pure monochrome signal, not color, not greyscale. Anything else produces flicker.

I think IFFs greater than 8-bit are dependent on different video hardware (like that of the Amiga, whose hardware supports HAM). Even the 12-bit IFFs generated by Cranach don't 'look' right on my display. But these are HAMs.

>I think a lot of the extra filesize is probably the header of TIFFs, there

The odd time, an LZW compressed TIFF is smaller than an equivalent GIF. But rarely. Still, both formats are palette-based and use LZW. Probably the TIFF header as you say.

>Since I use an STE, I try to keep the colours in GIFs to a maximum of 16

Yes, a very good idea to save bandwidth. I did batch conversions of my Web graphics and created separate monochrome versions of all the pages. More like thumbnails, though.

>I wouldn't mind being able to use the PNG format, but I haven't found any

GrafTool supports PNG, and is supposed to work on all Atari hardware. I can't say enough about this wonderful program, especially since it allows the optimizing of GIFs based on the amount of actual colors in use. See my credits.htm page for information on how GrafTool was used. There's also a link there to the GrafTool homepage, where this registerware program can be downloaded.

> attempted to install it (from the init shell). This package contained an

what version though? pre 1.0? I suspect so, as the IC mirror of umich has
not been updated for years (literally). IMO you should download the latest
MiNTnet from somewhere else - like pascal.math.fu-berlin.de

> MintNet Package ! My question : what's needed to install MintNet on top
> of my Mint, where can I get it, and what version/PL do I need ?

There are lots of other things, that are not included in the straight MiNTnet
package (eg. syslogd). Installing a suite like KEMD (based on KGMD) would
be a much easier sollution that installing it all by hand.

> * Is there any simple but reliable editor for Mint. Something like pico would

Pico has been ported, I believe. Check an up-to-date FTP site.

Anthony

3750. pipes and arguments

Why should HDDRIVER mention this? Floppy background DMA has nothing to

3756. Falcon IDE HD Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-18 00:00:00 UTC
From: Steve Johnson <sgjpdx@ibm.net>
Message-ID: <3498FAC9.F721C5D8@ibm.net>
Source record: 14691

I recently acquired both a brand new Seagate ST9140AG (140MB 2.5" IDE) and a very slightly used Seagate ST9420AG (420MB 2.5" IDE) and neither of them seem to work right in my Falcon. Both ICD's and the Atari HDX formatters will see the drives attached, but will refuse to format/partition either of them, reporting a connection problem. Any ideas??? Any help would be GREATLY appreciated!

Steve

"The idea that Bill Gates has appeared like a knight in shining armour to lead all customers out of a mire of technological chaos neatly ignores the fact that it was he, by peddling second-rate technology, who led them into it in the first place."

I have one of these little boxes with the Steinberg logo, although I
believe it was made by Sounpool.It works with most shareware stuff, plus
Zero X and Audiotracker. I'm not certain about Cubase Audio or Logic, but
I would be surprised if it didn't.Apparently there is a twenty bit upgrade
kit available from Soundpool.
Mine works well at 44.1k but I get noise at 48k, but I believe there is a
problem with my Falcon and not necessarily the Sounpool box.

Regards,

Bill

Steve

You should not try to format an IDE drive. ICD will not let you do it anyway. Go straight to "partition" instead of format and see if that works.

Regarding software based Atari ST emulators that run on Intel hardware, I've used STonX for a while and it is pretty darn good. I'm not much of a game player on the ST anyway (I have a Jaguar for games) so I can't give you much insite into how well it does low level TOS emulation but for all of the application software I've tried, it works great. STonX, as the name exposes, is an ST emulator for X as in the X Window System as in Unix. I run it under Linux which is the better OS for the Intel machines... in my not so humble opinion. :)

Thanks.

The confusion comes from the MagiC manual, which states that you need HD Driver to use floppy background DMA. That's why I wondered if the two were related. Obviously, they're not, so I can use floppy background DMA in MagiC, with hard disk background DMA turned off in HD Driver. That is good.

Thanks also for the info on the CD-ROM drivers.

To be honest the ST emulation scene is pretty crap if you want to play ST games - pretty far behind emus for any other system including the Amiga. It's a bit of a mystery as to why - very little effort seems to have been put in to creating an ST emulator which doesn't just emulate TOS. There was, a few years ago, an ad on board for PC which, with software, would more or less faithfully emulate an ST. The need for the extra hardware really begs the question though - what's the point. (Itwas fairly expensive to buy too.) Strictly speaking it wasn't an emulator; at least not in the sense that MAME, Snes9x, Callus etc. are emulators. I don't know if it's still made - I assume it isn't - nor do I know if its worth buying. Anyone else have the details.

Doesn't work with many - most - games. Also, it's bloody difficult to set up. The instructions that come with it make this clear - not meant for games - something along the lines of "don't contact me if a game doesn't work." Also, it has difficulty reading protected disks - the instructions also make this clear.

The unit you are talking about is the GEMulator. The hardware was only there so you could plug the TOS ROMs into it. This helped the maker (emulator guru Darek Mihocka - did I spell his name right?) avoid any legal hassles with Atari by forcing the user to use a legal, legit copy of TOS. Uses less drive space too, as well as giving you faster access than loading from a drive. The 68000 and other ST hardware IS emulated in software, so it IS a true emulator. I have seen this running on a relatively slow machine (I want to say it was a 386/50) and it matched the speed performance of a standard 8 MHz ST. As for price, last I looked it was only $99, including ROMs. But that was over a year ago.

Do you mean Janus ? It is a board that not only contains TOS on ROM but
also a Motorola-processor (I think a 68000). It is in fact a plugin
Atari-ST for pc, and AFAIK it is still sold in Germany. The good and bad
side of it is, that the speed of the emulation doesn't depend much on
the processor speed of your pc, but of the processor on the board.
I don't know if it is good at emulating games, especially because screen
output is still handled by the pc.

Marc

3778. ^C in TomShell

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-19 00:00:00 UTC
From: outrider@anv.net
Message-ID: <67dd2r$7j6$3@usenet89.supernews.com>
Source record: 14763

I use TomShell for all my batch work for importing/exporting FidoNet mail. Occasionally, a program (usually, JetMail, but not always) will show a ^C and an abort. This happens even with programs that don't support a ^C abort, so I'm guessing it's actually TomShell that's aborting, which in turn aborts the program its running. OTOH, TomShell continues with the next programs, so I don't know.

Anyone have any idea what might be causing this? I might not see it for several days or even weeks and then I'll have a whole slew of them (it's happened often today), even without changing my setup.

I'm running MagiC 5.11 on an STe, but it does it on my Falcon, too.

3781. Need help with NOS

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-20 00:00:00 UTC
From: outrider@anv.net
Message-ID: <67f917$7qb$6@usenet48.supernews.com>
Source record: 14766

I'm trying to get NOS working and am not having much luck. The docs
are sketchy at best, and extremely intimidating at worst.

I have my NOS_ROOT environment variable set, and I believe I have all
the folders and files in the right places. I've edited everything
the best I can, but no go.

If I start NOS with no parameters, I get the following:

Unknown host [0.0.0.0]
input line: ip addr [0.0.0.0]

If I try to use the dialer, with this:

dialer sl0 dial.txt

I get this:

Interface sl0 unknown

Any ideas?

I'm using the same mouse -- but without the problem in CAB you describe.
Are you using a mouse accelerator? I had to adjust mine to compensate for
the Wizard's higher resolution.

No, I'm not using a mouse accelerator. It's already way fast enough,
even on my small mouse pad.

It usually happens when CAB is busy on the modem port. I suspect
it's some type of overrun, that is, the hardware is trying to process
more than it can handle.

What kind of computer are you using?

'Mouse accelerator' may be the wrong term. I'm using a TT with a Nova graphics card. Within one of the Nova's accessories is a mouse handler (Mausbeschleunigung), and I had to use a different setting when the Wizard was installed. When set to off within this accessory, the Wizard moves too slow despite its higher resolution. The setting that worked best is labelled 'Dyn. 1', which I assume means dynamic. The 'Dyn. 2' setting was too fast.

Although I haven't tried it with the Wizard, you might want to install SilkMouse to see if that fixes your problem. I ran SilkMouse for years and found it highly configurable.

>

I just purchased the Geumlator 98 (Version 4.8) this last week and
installed it yesterday. It is much faster in my Cyrix P-200 system
with 64 megs of ram than my TT I use to own was.
Havne't had much time yet to test out various programs yet, but
will be trying some out over the next few days.

I think this is designed more for true applications rather than games,
since the speed of it would crash most games that are timing dependant
I believe.

That's what I was using before I got the Wizard.

The thing in CAB is not really a problem, because I've just learned
not to move the mouse too fast, at least when it's receiving data.

I'm pretty happy with the Wizard's speed as-is, and the button
response is the best I've ever seen in a mouse. My only complaint is
that traction is a bit inconsistant (and I've tried it with both a
cloth and a vinyl mouse pad), which I think has a lot to do with the
fact that it's too light, so you don't always have the proper
pressure applied.

I'm using a thick vinyl mouse pad that's securely taped to my desk. The
Wizard behaves on it. It took lots of packing tape, though, to keep the
pad perfectly flat. So much so, I think it's permanent now <g>.

Well, there I was, merrily typing away during
a rainstorm in lovely San Diego, California.
Naturally, I forgot that it doesn't rain in
California, so I was taken completely by
surprise when the electrical brown-out came to
visit.

My screen dimmed ... the computer paused ...
then everything went on working. With the
exception that my Falcon's UK keyboard now
responds like a USA keyboard.

Is there a way I can reprogram the CMOS-RAM,
informing it that I have a UK keyboard?

Thanks!

I don't think that's a problem here. My mouse pad couldn't get any
flatter. I think it's just a case of the mouse being too light,
because it works fine if I'm applying pressure to it, but that's a
tough habit to get into. It's possible I could get a better mouse
pad, though the (vinyl) one I have is new and seems well made.

I'm not sure about this one, but it could be that the 'temporary' setting refers to all those partitions/drives that are present when it's VFATCONF was booted, whereas the 'permanent' setting allows you to set up long names for the partitions/drives that aren't yet present, ie. for when you add another drive.

On the other hand, have a look at the MAGX.INF file and see what it's got in the line 'drives='. I have 'drives=ABDEF' which enables A: to F: except for C:. This is probably what VFATCONF is looking at and, you may find that one, or more, of your partitions are disabled in that list. If they aren't present, edit that line and add them. If they are present, then I've no idea.

Ehh? Why? Have you really tried the setup-programs available? (ie.
ASSIST?)

The instructions that come with it make this clear - not meant
> for games - something along the lines of "don't contact me if a game
> doesn't work." Also, it has difficulty reading protected disks - the
> instructions also make this clear.

Thatï¿½s strange! Most people I know that uses it seems to be playing
old ST-games. I donï¿½t though.
At the times when I havenï¿½t access to my old STe, I use
PaCifiST v0.46 on a 486dx50 to program in GFA. Maybe somewhat
bizarre, but it works! (TOS 2.06 seems _very_ stable under PaCifiST!)

I've just retuned to the ST after a while in Mac land. I'm
trying to remember all the ST tricks and useful software.
I'm trying to locate software called Ultimate Virus Killer
which had a very good systems check. I've not been able
to locate it. I assume it's stopped being made, but does
anyone know where to source a copy, preferably in the UK?

Thanks

Davy Lamb

3803. Mac/Atari transfer and zip? lzh?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-24 00:00:00 UTC
From: nospam@nospam.net
Message-ID: <nospam-2412971258360001@ppp78.enterprise.net>
Source record: 14788

I use a Mac for interent and have returned to the Atari ST for MIDI
music sequencing. I have downloaded some files to transfer
to the Atari but am not having much success.

If a file is described as a zip file what does this mean. I assume it
is a form of compression, so how do I uncompress it?

Other files have the extension ".lzh" Again I'm guessing a compression
system, but how do I uncompress?

When I'm dowmloading into the Mac, is it possible I'm saving it on the
Mac in a format that makes it unreadable to the Atari?

Excuse the many questions, probably quite basic, if you wish to Email me
direct rather than fill the list with stuff fell free. My Email is
davyl@enterprise.net - before you hit reply with your newsgroup software
note message below!

Many thanks,

Davy Lamb

Why would you assume that? Version 8 (a.k.a. UVK 2000) was just
advertised by its author a couple of weeks ago on this newsgroup.
In the US, Systems for Tomorrow should have it.

I'm trying to network my TT with my older ST machine using MiNTnet.
The TT is 192.168.0.10 (KGMD default), the ST 192.168.0.11 on STiK.

What is needed to establish a SLIP connection from the TT host?
TT runs MiNTnet, but I use STiK on the ST to save on cpu/memory.

Can anyone help? Please Cc your reply through e-mail. Thanks

Atari 1040st/printer- Star NX-10. I have two Star printers. I have
checked all cables and replaced them on both so it isn't hardware.
I have re-done all the commands in ascii from the book--all that's left
is it must be my word program or not maybe. Work Writer.
I have tried other printing functions (like Degas, etc) and nothing works
correctly. I get fragments words, backwards line spacing, etc. on any
printing yet when I run the test sequence for the printer, it works FINE!
THIS IS MADDENING. Is there anyone around Lakewood who would come to my
house to help? I'll feed them! HELP I need my printer to work again!

>TT runs MiNTnet, but I use STiK on the ST to save on cpu/memory.
>

Well this is doab;e quite easily, just slattach with the 2 addresses,
but the big problem you will see is that from the ST, you won't be
able to access the internet, because the TT (running MiNTNET) doesn't
support masquerading, So the ST will never get an answer because he
has an IP to NOT go on the net but stay on the local network.
What it means is: You can access files from the ST to the TT, via ftp,
or run CAB on the ST to view local HTTP document on the HTTPD server
located on the TT, but no way to access OUTSIDE the local network
without MiNTNET supporting masquerading(or get your provider to give
you 2 registered IPs)

Hope this helps and wasn't wrong.

3810. Hard Drive problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-24 00:00:00 UTC
From: outrider@anv.net
Message-ID: <67s6fc$rl5$1@usenet51.supernews.com>
Source record: 14795

You may have seen my thread about problems I was having with background DMA causing my drive to "fall asleep" occasionally, during a read. Well, apparently, that was only a symptom of things to come.

It's now doing it without background DMA and doing it more and more. But unlike before, it doesn't wake up. It gives an error saying the drive is write protected, but quite often this error happens during a READ operation! And occasionally, I get the "Device hasn't received any output" or something like that.

Usually, I can get past it by turning the drive off and then on again, and then clicking on the Alert's Retry button. Occasionally I have to do it twice before it works. Obviously, this is not real good on the drive, and as I said, it's getting worse.

I'm using an STE with MagiC 5.11, HDDriver 7.04, ICD AdSCSI+ host and a Maxtor 213 meg hard drive.

Any ideas what might be causing this? Bad host, drive, DMA?

Thanks and happy holidays!

Thanks for the suggestion, Bud. I neglected to mention that I'm not having much luck with my CD-ROM, either, so obviously that rules out the hard drive. That means it's probably either the ACSI port, the host adapter or the cable. (I may have another cable to test.)

Indeed. Find STZIP26.TOS which will unpack to give you the latest Zip
packer/unpacker.

>Other files have the extension ".lzh" Again I'm guessing a compression
>system, but how do I uncompress?

Right again! Look for LHARC v3.10. It's just another compression
method on the ST.

From: outrider@anv.net
Message-ID: <67vmff$1n7$1@usenet76.supernews.com>
Source record: 14706

I've set up Oasis 1.35e and am having some troubles getting it to work with NOS. If I drag STARTUP.NOS to NOS.TTP (POP3 version), it loads, dials, connects and logs on to my ISP. From there I haven't really been able to do anything, but then, I don't really know what I'm doing, either.

If I try to log on from Oasis, I get a blank white screen for a second, as if it tries to load NOS, but then it comes right back and tells me it's integrating new areas or something to that effect.

I know it's finding NOS.TTP, because if I move it, it gives me an error saying it can't find it. And I know it's finding STARTUP.NOS, because my settings show up in the Edit Settings dialog.

I'm running on a 1040STe with MagiC 5.11 and Ease 5.01.

Any ideas what's causing this?

Ease doesn't handle the AV-protocol correctly. Perhaps that's the reason.
I think SMU sends an AV_STARTPROG message to Ease and Ease some kind of
ignores the command line parameter.

1Mb is a bit tight for www but he wil be OK for mail, news, ftp.

The easiest way to get going is:

HSMODEM - to cure serial port problems
STiK - TCP/IP stack and dialer for SLIP connection (if he must use PPP
then he will need to use STiNG - a bit more difficult to set up)
Newsie - for mail, news and ftp.

All public domain and available almost anywhere. Best starting point
is probably:

I can display material from Russian web sites on CAB but, of course,
it all looks like nonsense in normal Roman fonts.

I have obtained a Cyrillic font but this does not seem to make things
much better.

It looks as though the characters in the Russian text are all high
ASCII occupying the positions usually taken by the European national
variants.

Perhaps it is not a normal Cyrillic font which I need for the browser
- more like a Roman font with Cyrillic extensions in high ASCII.

Anyone know what I should be doing?

And ,perhaps, where I can find the appropriate TTF or SPD font.

Can anyone direct me to a source for printer drivers for the Atari ST 4 Mega? I have an HP 500 series printer. I purchased this unit used essentially for music (sequencer & Hard/Driver Recorder) production. I have very little experience with Atari's, although I have been using the installed programs with no problem. Any assistance/information is greatly appreciated. Thanks!

Running STinG on the TT gets around this problem as STinG is capable of
IP masquerading. But I fear that's not an option for qfunk ?

Source record: 14719

I picked up a 520STe from a friend, and he got it with no manuals or floppies. I'm just fooling around with it, and may install Linux. It's got 2 ICD hd's, I think 40M each. I accidentally configured it to boot from floppy without copying the hd driver to a floppy. I got the ICD utils off the net, ran the driver and then went to configure it to autoboot from c:, but it needed autoboot.prg or whatever. As I was figuring out what to do next, it froze. I toggled the power switch, and now I don't even get the atari logo, just a white screen.

Is it beyond repair? What might be wrong?

From: graeme_dobie@saqnet.co.uk
Message-ID: <19971229001103.graeme_dobie@saqnet.co.uk>
Source record: 14721

I have an 'old' STe, which I alwats intended to fix up with a genlock.

I've got a small chip which produces timing signals from a composite video source, but can't quite seem to get the ST to 'lock' - I suspect I need to a) buffer the video signal(s) before mixing, and b) switch off teh ST internal video clock.

thw Monitor port has pin 3 - clock select (needs to be high/low? +- 1v, +-5v???) pin4 - Monochrome detect/clock input, +-1v, +-5v??? 25Hz/ 50/60Hz or every line???)

Any help appreciated

Rgds GRD

3837. Anybody genlocked an STe?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-29 00:00:00 UTC
From: graeme_dobie@saqnet.co.uk
Message-ID: <19971229001531.graeme_dobie@saqnet.co.uk>
Source record: 14722

Have an STe, want to know how to genlock.

Suspect pins 3 & 4 of the monitor port have something to do with it, do I tie them high (+5v) low (earth) and/or pulse the other with a +1 or +5 volt signal?? - even then - is it on every line, or just the blanking pulse??!?

I've got an 8 pin chip which strips out the timing pulses - propose to fire them into the ST.

Early experiments would suggest I have to buffer both the external and ST video lines before mixing - any hints?

Any help appreciated

Rgds & happy new year (when it comes)

From: mike@bbsgate.interware.REMOVE.TO.REPLY.it
Message-ID: <712_mike@bbsgate.interware.REMOVE.TO.REPLY.it>
Source record: 14726

I have in problem in the Atari NOS development. I get a DOS_XFS error in MagiC 5.03 that locks the system.

- the error seems to appear while trying to fclose a file that was also fopened and fclosed in a (parallel) subroutine.

- I could only test the error in MagiC 5.03 on an Atari TT030

- there is no error on plain TOS and MagiCPC (MagiC 05.02)

- I tryed cbhd and hddriver, various AUTO combinations

- no documentation about that DOS-XFS error

- NOS actually compiled with Lattice C

What could be responsible for this error ?

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

No, nothing here.

: I'm using an STE with MagiC 5.11, HDDriver 7.04, ICD AdSCSI+ host and
: a Maxtor 213 meg hard drive.

MegaSTE, MagiC 5.20, HDDRIVER, AdSCSI+ + internal, several drives.

: Any ideas what might be causing this? Bad host, drive, DMA?

I noticed that floppy background DMA doesn't work, too. Even with a floppy
only installation of MagiC. I guess it must be a problem with MagiC and
(or?) the STE hardware.

But it's odd that it was happening consistantly with background DMA
turned on and it never happened with background DMA turned off, at
least till lately.

>> Any ideas what might be causing this? Bad host, drive, DMA?
>
>I guess that the drive is broken.

What's odd is that it was getting really bad where it was happening
quite frequently, and it got to the point where my drive would shut
down momentarily and then start back up. And this was happening
quite frequently also.

So I took it apart and tried a different plug from the power supply.
Well, that didn't work, as I couldn't get the drive to power on at
all. I plugged back in the original plug (which was secure to begin
with), and the drive powered up and I haven't had a single problem
with it since!

Now I'm afraid to touch it. I don't even want to put the case cover
back on! I still think it could be the drive, as it's always been a
bit flakey, but now I'm thinking it might really be a power supply
problem.

Very strange.

Running STinG on the TT gets around this problem as STinG is capable of
IP masquerading. But I fear that's not an option for qfunk ?

Yes, but STinG lacks NFS and other MiNTnet tools I need on the TT.
However, my ST remotes could use STinG or STiK.

Perhaps it's time we asked Kay to include masquerading in MiNTnet.

I think Modem 2 has 'funny' speeds higher up its range which may not
be recognised by standard modems.

Have you still got Serial 2 spare? I am using this at 115k2 into a
28k8 DCE modem. It is very reliable. I have HSMODEM7 installed.

Here is additional info:

I am using MagiC v 5.03 on a TT with 4 meg ST and 4 meg TT ram hooked to
an external USRobotics Sporter 28.8 Modem via Modem 2 port.

When I use the terminal mode on Iconnect to login in manually to the
system, I get the standard login screens for user ID and password, then
I get the following:

PPP session from (198.109.38.10) to 198.109.38.12 beginning....~}#!}!}!}
}4} and every few seconds more "strings of garbage characters" fill the
screen until it finally hangs up.

Has anyone know why this is happening?

Thank again,
Neron

Hi,

I have made TOS-IDE card for ST and sold a few to friends. PCB is roughly 10 x 6 cm and it can hold up to 1 Mb of EPROM on it (starting at 14 Mb boundary- ideal for TOS 2.6) and it has buffers and all the logic required for connecting IDE HDD on it. It works well, but I decided some time ago to correct a few little mistakes on PCB and make it accesible on the Net (except maybe code for GAL chip on the card, which I could send to you already programmed for small fee- something around $10 + posting charges).

Hovewer, due to high workload, I couldn't do it by now, even though it would require cca. 10 working hours to correct PCB.
So, at the moment, I could post you schematics (for free- i think it's in DOS TANGO format), old PCB file (same as for schematics) and programmed GAL 20V8 ($10+posting).

I remember that I managed to work myself a simple 16 MHz accelerator that worked particularly well with TOS-IDE card, since it could run TOS 2.06 code at 16 MHz entirely and got nice speedkick from that fact.

Regards,

Branko

There are a couple other common compression formats to watch out for.
One of the oldest is the .ARC type. The other that comes to mind is the
.ZOO type. You should be able to find PRGs that will handle these types.

As Roger pointed out, the most important thing when dealing with
compressed files is that you have to transfer them in binary mode. When
you are downloading (or uploading) any binary file (anything that is not
just plain text, like a PRG or a ZIP), you should make sure your software
is using a binary transfer mode. You should be fine if the download comes
straight to your computer in one step. You can check compressed files
using the appropriate decompresser (they always test them before trying
to decompress anyway).

If you have to use a 2 step download, like I do, this probably means you
have a shell account. (This means you can run programs on the computer you
dialed in to. The shell is the program that you run programs from.) In
that case, FTP the file to your host computer, then send it over the modem
with sz (stands for send Z-modem). ie you should do this:
sz -b myfile.zip
(the -b switch tells it to use binary mode transfer)
After that, you need click on the receive Z-modem button in your terminal
program. Then your done :)

--
You might find this info, taken from Dave Small's article, "TTerrific"
from STart, Feb 1991:
hardware (RTS/CTS)
Max bps handshaking description

Modem 1 19200 yes fully ST compatible, run from MFP
Serial 1 19200 no three wire, run from MFP
Modem 2 900000 no three wire, run from SCC
Serial 2 900000 yes full RS232, like Modem 1, uses SCC

The MFP is the Multi Function Peripheral chip. It oversees the operation
of everything else (midi, floppy controller, keyboard UART, etc), runs 4
timers, and does RS232 serial . The ST has one, the TT has two. The SCC is
(just a guess) the Serial Communications Chip. All it does is serial IO,
but it does it well, using DMA. Dave Small says, "This chip is the
absolute cat's meow for serial communications." In STE/TTs, it runs the
LAN port, found next to the MIDI ports.

--
That is weird.

The internal floppy power connector uses 4 pins, the middle ones are
ground. The red is +5V, blue= +12V, black is ground. I hope this helps,
but I'm guessing it won't. If you have a cable, you could hook up the
drive and test voltages relative to ground on the computer, or check for
continuity to power supply outputs if you don't want to turn on the
system.

3858. MAGIC 5.13 - HD floppy - Problem !

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-30 00:00:00 UTC
From: acounis@lpnsu7.in2p3.fr
Message-ID: <68aoof$218$1@ccpnws.in2p3.fr>
Source record: 14743
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello World,

I am having problems using HD floppies under MAGIC 5.13 / MAGXDESK.
Formatting takes a looong time (more than 10 minutes when the floppy is not
rejected) and often does not end very well : it complains about sectors/tracks
not valid. Under TOS 2.06, no problemo.

Reading/writing to a HD floopy crashes most of the time : sector/track not
valid. Again, TOS 2.06 doesn't complain.

Formatting/Writing/Reading with a DD floppy does not cause any problem.

I am using a MegaST12 (yes 12 Megs!) with a home-made HD module (Ajax
controller). As I said before, I don't have any problem under TOS (either with
DD or HD floppies)

The problem is the same with preemptive or cooperative multitasking.

Anyone has the same problem than I have ? Especially people with a MegaSTe or
TT ?

If so, email me (with a detailed setup of your machine/software)

My machine: MegaST4 with Aixit Magnum ST, MAGIC 5.13, Magxdesk, CBHD5.02, PAK3
68020, home-made HD module with a real Ajax.

Thank you.

While we're on this subject...

I've got a Zip drive on my Mac and one on my Falcon. The Mac reads new Zips as a PC disk, the Falcon won't unless I partition it. If I partition it the Mac won't read it anymore.

I believe I need BIGDOS on the Falcon to read the Zip disk without partitioning it? I've been trying v8 but it only works with HD driver and I'm using AHDI. According to the docs there should be a patch for ADHI6061 but it's not in the archive.

I've heard that the latest ICD v7 now reads BIGDOS disks? Trouble is ICD driver I've got (6.4.3) don't work with Magic on my Falcon. Have they fixed this?

Baring this is there any Atari prog that can format zip disks in a way that both Atari and Macs can read? Floppies work fine if I PC format them with Kobold but Kobold doesn't format Zip disks:(Also floppies PC formated on the Mac work on the Falcon but the Mac PC formats Zip disks to BIGDOS (95.9Mb)

I'd really love to get this sorted as it's a PITA being stuck with the filesize limit on a floppy.

The only other way is to connect the Mac and Falcon together and do it via comms progs on each. But how do I do that?

Chris

On 30 Dec 1997 07:10:48, Peter Cordes wrote:
You might find this info, taken from Dave Small's article,
"TTerrific" from STart, Feb 1991:
hardware (RTS/CTS)
Max bps handshaking description

Modem 1 19200 yes fully ST compatible, run from MFP
Serial 1 19200 no three wire, run from MFP
Modem 2 900000 no three wire, run from SCC
Serial 2 900000 yes full RS232, like Modem 1, uses SCC

This info is partially inacurate: 900k baud is the theoric maximum
baudrate available from an SCC by design. Actual speeds are largely
dependant on RTxCA, RTxCB and PCLK frequencies.

All Atari machines equipped with an SCC use an 8 MHz PCLK. However,
the TT (being Atari's first experiment with SCC chips) has its two
ports clocked on different rates, so Serial2/LAN has 57600, 115200
and 230400, while Modem2 has 76800 and 153600.

Also, Modem2 is exactly like Modem1 (DTR pin & all). Therefore,
Serial1 and Serial2/LAN are the ports without handshaking.

Note that one CAN modify TT-Modem2 to use the same RTxC as LAN,
to acheive 57600 and 115200. However, you MUST use HS-Modem to
patch TOS because it EXPECTS Modem2 to have certain baudrates.

This modification is described on my homepage.

Cross-posted to: alt.games,comp.sys.atari.st.tech,rec.games.video.atari

Well, it might well work with most games - as long as they don't use wanky disk formats. Big problem that - changing or cracking the format of protected games. The version I have isn't too good with real disks anyway. I don't think that MS-DOS can read TOS1 disks - at least that's what my readme file says.

Even if you succeed you'll have problems archiving disk to file for other people to use via download - none of the archivers seem to be able to handle odd formats even though a decent copier can.

Then you've got the problem of silly people complaining about piracy of 10 year old games - the companies don't exist anymore in most cases. Too much trouble to get the best out of ST emus - they might, given the right disk format, be able to do quite a lot. Who knows? Who cares?

The SC 1224 is specifically designed for use with the ST. There should be no
problem. Does the power led come on ? if not, then the power supply might be
dead. Otherwise, the monitor might have some other problem.

3865. ST exp. technical questions?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-30 00:00:00 UTC
From: Branko Badrljica <brankob@svet-el.si>
Message-ID: <34A8AAD9.5B3F@svet-el.si>
Source record: 14800

Hi to all,

I would like to make for myself turbo-expansion board for ST with IDE port for HDD. I've already made several years back ordinary TOS&IDE card for ST, but now I have nice 68EC000FU20 (=68000 on 20 MHz declared CMOS in nice PQFP package) and several 29C040-70 FLASH RAMS. I intend to use most of them for other project, but I would like to use excess for good cause, so i would like to make step forward from old card whose only novelty was IDE interface, so I'm curious about:

1. TOS 2.06 bits
I have solid knowledge about 68K assembly, but know almost nothing about TOS and such stuff. Is there simple to understand resource on the net or at least reference to a good (and still accesible) book on the subject ?

2. More than 4 Mb DRAM expansion

I know about existance of 8 Mb DRAM boards for ST, but I have never seen schematics of those. Those products also needed special driver to link upper 4 Mb and also posed severe restrictions about use of it. Since MMU can controll only 4 Mb, one could probably add one or two MMU's and have 8 or 12 Mb of RAM, but since MMU contains also address counters for DMA transfer and video shifter, how could one persuade TOS 2.06 to work with that arrangement. Another problem arises when screen is allocated on the border between two 4Mb blocks etc.

3. TOS 2.06 provisions for extra memory

I've heard recently about some new expansion cards, which can accomodate up to 12 (or even 14) Mb of RAM, with no need for special software drivers for it. It seems that TOS 2.06 already has some kind of provisions for extra memory. I wonder if anyone would know something more specific about it. Would it help if I would programm CPLD or something like that to act like old MMU but with fully expanded 24-bit registers to address all 16 Mb minus TOS & I/O ? What should be the bit combination in MMU's bank combination register. Should the new MMU have also some new registers and which ? etc. etc.

3. MMU specific things...

Has anyone a clue how MMU presents CPU's addresses to DRAM every bank cofiguration and especially in 2+2 Mb?

I mean, since DRAM has multiplexed address lines, MMU has to multiplex CPU's address lines A1-A21 to DRAM's address inputs MA0-MA9. There is practically infinite number of ways to do this. Untill you don't

interfere with MMU's business, this is not important, but I want to make low cost read-only DRAM on my card,which would be constantly consistent with main RAM on the mainboard, so processor wouldn't have to flush on card cache after every DMA write or Blitter operation. Expansion card could sense every write cycle directly on the pins of main RAM, and duplicate it in the RAM on the card. I could tinker something to my ST and check it out, but it seems painfull and tedious, so i thought asking first could be good idea....

4. IDE things....

I have come across many hard disks which wouldn't work with my card (and would otherwise fine with a PC). Partial reason for this is ST's lack of CMOS memory, in which it could memorize relevant parameters of disk (heads, cylinders and such stuff).
I wonder if TOS 2.06 already has provisions for connecting a batery backed up RTC with small SRAM (which one ?) and in which way (on which addres range) it expects to see it.

In my last card all the logic was in one GAL 20V8, so I couldn't do fancy stuff with IDE interface, like you can find in PC's CMOS (number of clocks per access, IORDY termination etc,), with the use of CPLD's this should be possible. On 32 MHz CPU speed, disk op's should fly...

Even multiple IDE ports should be trivial from hardvare point of view (except maybe phusical dimensions- card must be small), but I wonder if there is a software driver that could take advantage of this, otherwise, although trivial, it's not worth the bother.
Still, it would be nice to have three IDE ports for example;
one for main disk, one for backup disks and one for low cost IDE CDROM unit...

5. DMA chip

Does someone know specific things about it-like timings and protocol on it's ACSI port ?

6. Video Shifter

From what I know about it, it could be easily realised in the CPLD, if it
wasn't the fact that it has video pallete RAM and quite awkward memory arrangement of the pixel in memory. In 16 color mode this means that shifter would need 64 flip-flops just to latch all data before it can be serialised. Add to that what you need for video pallete, look up for adequate CPLD, look at the price tag for it and you'll understand...
BTW: Does someone know anything about pixel arrangement in Falcon's 256 and more colours modes and TT's VGA modes ?

7. Overscans & stuff

I understand hardware side of overscan, but have troubles with software. There was once published an overscan along with assembly source code

with comments (I think author was Carsten Isakovich), but all the
comments were in German (which I don't understand) and also resulting
code didn't work for me.
Probably because i tried it with TOS 2.06...

Sorry about the length,

Branko

Well, the symptoms are slightly different.

When I was having the (apparent) power supply problem, when it would stop working, it would stop completely until I got an alert telling me the disk was write protected. I had to turn off the drive and then turn it back on.

The symptoms with background DMA are such that it goes to sleep for several seconds and then wakes up and continues on its merry way. I never get an alert and I never have to turn off and on my drive to wake it back up.

And now that my hard drive has been working flawless for a couple days <knock on wood>, I decided to give background DMA another shot. Sure enough, right off the bat it goes to sleep for about 20 seconds and then wakes back up. This is not happening with background DMA off. I'm not saying background DMA is at fault here, but it is DEFINITELY related to this 'sleep' problem I'm having. The apparent power supply problem I was having might just be a coincidence, since the symptoms are different.

Lines 39 Ultimate Virus Killer 2000 - SPECIAL OFFER! No responses
karies@wxs.nl Ritchie at World
Access

Good day to you all, Atari friends!

I am releasing a definitive version of my "Ultimate Virus Killer",
now called "Ultimate Virus Killer 2000", version 8.0. Now is your
chance to get your hands on the definitive piece of virus killing
software for the Atari ST/TT/Falcon range of computers. Here's what it
can do...

1) It can kill more viruses than any other virus killer...right now
over 100!
2) It is the only virus killer that can recognise "UVD Virus", "Carpe
Diem Virus" and "Pharaohs Curse Virus"
3) For the past two years or so it's been the only virus killer that's
still updated, and it will continue to be updated at least twice per
year
4) It works on any ST/TT/Falcon system with 1 Mb of memory (or more)
5) It supports any multi-tasking OS that exists
6) It also runs on GEMulator and PacifiST on the PC

This piece of software can now be yours for the amazing price of US$
10 (or 5 British pounds, or 15 German marks, or 15 Dutch guilders) -
and that includes postage! And the special offer is that, if you send
off your order before 1 january 1998, you will get the next update (to
be released around summer 1998) COMPLETELY FOR FREE (sorry for my

shouting :-).

So don't think twice and get the definitive virus killing tool for the Atari range of computers, the "Ultimate Virus Killer 2000" version 8.0, right this minute.

If you need more info, email to me at karies@wxs.nl.

The address to order at is Richard Karsmakers, P.O. Box 67, NL-3500 AB, Utrecht, The Netherlands.

Of course, while I'm at it, I would like to use this message to wish all of you the best Christmas you've ever had, with a cool 1998 to follow!

3871. Re: ST exp. technical questions?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-12-31 00:00:00 UTC
From: Anthony Jacques <jacquesa@zetnet.co.uk>
Message-ID: <19971231212354809 56@zetnet.co.uk>
Source record: 14806

Hi. I cannot help too much with the hardware stuff (I'm a software guy)
but I can help on a few points...

> I would like to make for myself turbo-expansion board for ST with IDE

Sounds like a very big project! Also a great one. :)

> 1. TOS 2.06 bits
> I have solid knowledge about 68K assembly, but know almost
> nothing about TOS and such stuff. Is there simple to understand
> resource on the net or at least reference to a good (and still
> accesible) book on the subject ?

The Atari Compendium. The book version is out of print, I believe. However,
IIRC copies of the CD-ROM version (HTML and PDF, plus a dump of UMICH) are
still available from the usual sources (I got mine from System Solutions).

> 2. More than 4 Mb DRAM expansion
>
> I know about existance of 8 Mb DRAM boards for ST, but I have never seen

Someone (Gerry O'Rorke?) posted here not too long ago with details of
his own DIY project... a search on deja-news would probably help you.

> 3. TOS 2.06 provisions for extra memory
>
> I've heard recently about some new expansion cards, which can accomodate
> up to 12 (or even 14) Mb of RAM, with no need for special software
> drivers for it. It seems that TOS 2.06 already has some kind of
> provisions for extra memory. I wonder if anyone would know something
> more specific about it.

TOS 2.xx and above (including Magic) provide the function:

long Maddalt(voidp start, long size) /* gemdos 0x14 */

this informs GEMDOS of the existence of additional "alternative" RAM that would
not normally have been identified by the system.

Start indicates the starting address for the block of memory to be added to the
GEMDOS free list. size indicates the length of this block in bytes.

Maddalt() returns E_OK (0) if the call success or a negative GEMDOS eror code.

This call should only be used to identify RAM not normally identified by the
BIOS at startup (added through a VME-card or hardware modification).

> I wonder if TOS 2.06 already has provisions for connecting a batery
> backed up RTC with small SRAM (which one ?) and in which way (on which

> addres range) it expects to see it.

Newer machines (MegaSTE, TT, Falcon) have NVRAM (non-volatile RAM).
These machines (which all have TOS 2.xx or greater) provide a function
which allows read (op=0), write (op=1), or clear (op=2) on NVRAM:
WORD NVMaccess(WORD op, WORD start, WORD count, char *buffer);
/* xbios 0x2e */

All of the locations are reserved for use by Atari and none are currently
documented - however there are programs that set the NVRAM (on the Falcon,
at least), so it is known what this stores - although I dont know if it
is suited to your needs.

> Even multiple IDE ports should be trivial from hardvare point of view
> (except maybe phusical dimensions- card must be small), but I wonder if
> there is a software driver that could take advantage of this, otherwise,
> although trivial, it's not worth the bother.

Dunno... but I bet Uwe will tell us if he is reading.

> BTW: Does someone know anything about pixel arrangement in Falcon's
> 256 and more colours modes and TT's VGA modes ?

256 mode is planar - basically an extension of ST modes. 8-words, each
storing the n'th bit of the first sixteen pixels, followed by 8 more words...

16 bit mode is chunky, with 1 WORD = 1 pixel (RRRRR GGGGGG BBBBB format).

Tell us how you get on!

Anthony

Hi Pio!

p> Organization: Pacific Bell Internet Services
p>
p> Can anyone direct me to a source for printer drivers for the Atari
p> ST 4 Mega? I have an HP 500 series printer. I purchased this unit

You need to be more specific, since many programs have their own drivers.

However, you should have no difficulty with your printer as most progs have
either a Deskjet or Laserjet driver which will work with your printer.

Speak to 'ya later!

j> figuring out what to do next, it froze. I toggled the power switch,
j> and now I don't even get the atari logo, just a white screen.

I suggest disconnecting the hard drives from the DMA port at the back of the ST, and try booting up with no disk in the internal drive, you should get the desktop up after a wait of a couple of moments.

If this is successful then you're likely to be OK.

Speak to 'ya later!

Ok, Bran:
My TT has a 56K modem on Serial 2, HSModem7 (must include SCC.PRG
but I don't know why); SERIAL.CPX with 115200 (Atari's MODEM.CPX
deleted); STING.CPX active.
Transfer-speeds seen in Oasis2/Ice up to 9000 b/s but usually 3000 plus.
Bye, Charles.

Terry, I have been reading your posts and have come to the conclusion that your problem sounds more like a bad DMA chip than any of the rest. Atari had a few flakey chips that worked and than went tits up sometime later. What is the P/N # of the DMA in your machine? The chip number that you want is CO25914-38A. If you do not have this chip, you might want to think about replacing it. Hope that this helps you out. By the way I do have 2 of these chips in my stock of replacement parts. Let me know.

Hello,

first a happy new year...

i'm looking for a modification file that describes how i must modify the
F030 so that i can use the MFP chip as extra
serial port. (there was something with adding a MAX232 orso)

if you have such file/info, please send it to: pe1nib@telebyte.nl

thanks in advance, greetz Chris

3880. MSTe SCC?? NOT WORKING!

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-02 00:00:00 UTC
From: unsilva@king.mcs.drexel.edu
Message-ID: <68ht88$7gs$1@tom.pppl.gov>
Source record: 14815

I have a MSTe which I bought from Toad during their little motherboard
sale. There is apparently something wrong with it though.
Modem1, the MFP works fine but alas only goes to 19200.
Modem2, it works. But all files downloaded are corrupt in some way,
even with the same damn modem !!! :)
Serial2, for the life of me, this port won't work at all. It won't
recognize it or anything. I can't even type atz etc. But it is
connected correctly. It is not a stupid little problem, not cables,
I am more intelligent then that. But I am very unsure of the problem.
Is it the SCC chip itself??? Does anyone else have this problem?
Thanks.
Mark

>that's aborting, which in turn aborts the program its running.

Very likely.

>OTOH, TomShell continues with the next programs, so I don't know.

This is a feature of many command shells - they can effectively
execute themselves, and may do so before executing a batchfile or a
command in a batchfile. In effect, the shell you "see" when typing has
been suspended and a fresh one has been set up for the batchfile to
"see" which is destroyed when the batchfile finishes, leaving you back
at the original shell, unaware that any of this has happened.

>Anyone have any idea what might be causing this?

Any program which makes certain system i/o calls will be stopped by
the operating system if there's a ^C waiting around. Thus, if the
above applies then even if the program itself does not allow ^C the
"unseen" shell which is executing that command might. This unseen
shell gets terminated and returns to the parent shell - which is most
likely to be the one in use by the batchfile so the other commands
continue to get executed by it.

>I might not see it
>for several days or even weeks and then I'll have a whole slew of
>them (it's happened often today), even without changing my setup.
>I'm running MagiC 5.11 on an STe, but it does it on my Falcon, too.

Somehow you're getting ^C into the keyboard buffer. This might be
because one of the files being processed has ^C in it and is being
treated by the shell as though you typed it.

The other possibility is somewhat related to the "stuck key" syndrome
we all sometimes get when the machine boots. MagiC is a little more
prone to this than Tos - although in my experience if it's going to
happen it does so when you start the shell and striking any old key
stops it.

My guess is that it's the first problem here.

>
>Any ideas what's causing this?

Yes. It isn't finding nos.ttp and startup.nos ;-))

Oasis cannot find nos.ttp when it tries to run it (a bug) so does
nowt. It doesn't even bother checking if nos even ran which is why it
promptly starts unbatching news and emails - which don't exist of
course!

The solution is, as you nearly discovered, to execute nos directly
yourself. Except now, nos gets confused so get Ease to do it. Set up
nos.ttp as a singletasking process and give it a predefined command
line of

startup.nos -s 40 -d d:\oasis\

where "d:\oasis\" should be changed to whatever folder the oasis.prg
executable is sitting in (ie the one with the SPOOL folder in it).
Give it a keyboard shortcut or icon etc.

Whenever you want to go online, exit Oasis then hit your keyboard
shortcut for nos.ttp - let it do its stuff, exit then rerun Oasis. Now
click on the "unbatch" option and you've just done everything Oasis
would have done had it not had a bug.

But why would it give me an error if I move NOS.TTP, saying it can't find it, but I don't get the error when it's in the same path? It must be finding it, because it's not giving me the "not found" error.

>Whenever you want to go online, exit Oasis then hit your keyboard

Thanks, but ultimately what I really want to do is to get NOS working. I don't really care about Oasis. I just wanted to use Oasis to access NOS, because wanted to use it as a front end until I was sure NOS was working. If I can do all that you suggest, I have no reason to load Oasis after I'm done. (I'd be using Net2Net instead.)

I see. So there would be no evidence, such as the screen clearing or
a new VT52 window or anything like that?

>Somehow you're getting ^C into the keyboard buffer. This might be

Interesting. That makes sense.

I do have keyclicks turned on, though, so I can hear when I get the
stuck key syndrome. (Happens sometimes when moving the mouse too
fast while the modem is busy.)

>My guess is that it's the first problem here.

I had it happen yesterday and thought I'd see if turning off buffers
in VT52 would fix it. It didn't. So then I simply quit VT52 (I have
it configured to stay resident), and when it restarted it didn't
happen with the 'new' VT52. May have just been a coincidence, but it
gives me something to keep in mind if it happens in the future. I
may end up configuring VT52 to terminate when done, though I'd rather
not.

Tell me about it! I still haven't had any problems since turning
background DMA back off <again, knock on wood>.

The time it fell asleep (and where it's happened often in the past),
was after the AUTO folder ran, but before the desktop came up. I'm
guessing it happened when COPs loaded and the MagiC Timeslice CPX
turned on preemptive multitasking. But even if I let it get past
that part, it will still fall asleep from time to time elsewhere
while doing a read operation.

No, but there is a GEM clipboard protocol built into the AES. :-)

Everest supports it (make sure that "Parameters" -> "GEM Clipboard On"
is checked).

CAB, IIRC, doesn't support selection of the pages, so you cannot copy
and paste from there... I'm not sure why this isn't implemented - maybe
it has been, as I have an old version...

Newsie - no idea, but it should support it.

Anthony

CAB still does not support this feature (as of 2.5 anyway, the latest release here in the US), despite the fact that I have requested this several times for several years now. It may be difficult to implement, I don't know. Anyway, Alex has implemented cut and paste into the URL dialog now, I think this may have been his interpretation of my request, but probably was just his own idea, and it doesn't really do what I wanted to do, which is be able to cut text out of a web page and paste it into something else, like my telnet window or something. But at least I can copy important URL's out for mailing to people.

: Newsie - no idea, but it should support it.

I don't think Newsie supports cutting and pasting of text from its windows either, sadly. Of course, you can configure Newsie to use an external text browser to read articles, say Everest, and then you would be able to copy text to the clipboard (assuming you have configured Everest to use the standard GEM clipboard).

Is there any change one must set the Environment variable for NOS?
For MiNT it's something like this:
setenv NOS_ROOT=D:\OASIS

NEWSie currently supports cut and paste for newsgroups between windows
only. It's really limited at the moment. An editor is a much better
choice for character cut and paste.

>that arrangement. Another problem arises when screen is allocated on the
>border between two 4Mb blocks etc.

TOS 2.06 will work fine with up to 14MB of ST-RAM - I think a small patch is
needed for the floppy routines, since they assume that all memory above 4MB
need to be done via the _FRB fast-ram buffer.

Martin Wevelsiep successfully built such an expansion (I think the STE
version is still available, the ST version is not). However, it was a lot of
effort (~10-14 GALs depending on version IIRC), and the STE version is *not*
plug-in but requires a lot of soldering on the board.

The easier solution is to add alternate memory - ie. memory which is not
accessible by DMA or Video. TOS 2.06 can handle this (you simply need to
call Maddalt() with the address and TOS will use it).

This can be done with a small CPLD or even some small number of GALs.

There are several such cards, one of which is the Magnum series (F030, ST,
STE) which are plug-and-play (1 wire for MagnumST if you don't have TOS 2.06
on board) (I wrote the drivers for these).

>more specific about it. Would it help if I would programm CPLD or

>registers to address all 16 Mb minus TOS & I/O ? What should be the bit
>combination in MMU's bank combination register. Should the new MMU have
>also some new registers and which ? etc. etc.

This hasn't been done yet, IIRC. Martin's solution for 14MB ST-RAM used the
original MMU plus a lot of logic between the MMU and the ST board.

>I have come across many hard disks which wouldn't work with my card (and
>would otherwise fine with a PC). Partial reason for this is ST's lack of
>CMOS memory, in which it could memorize relevant parameters of disk
>(heads, cylinders and such stuff).

IIRC, only a small number of disks need to be told their geoetry - all
modern drives that work with auto-configuration on a PC should work. If not,
it is most likely that yout IDE timing is not as it should be.

Especially, even those drives should work if you start the driver from
floppy (ie. you can't boot from them, but then they are fine. If not: see
comment above).

>I wonder if TOS 2.06 already has provisions for connecting a batery
>backed up RTC with small SRAM (which one ?) and in which way (on which
>addres range) it expects to see it.

TOS 2.06 supports a standard MegaST-style RTC (Ricoh RP5C15 on the right
addresses), but only uses the clock from it, so it won't help you to boot
from one of the mentioned critical drives.

>In my last card all the logic was in one GAL 20V8, so I couldn't do
>fancy stuff with IDE interface, like you can find in PC's CMOS (number
>of clocks per access, IORDY termination etc,), with the use of CPLD's
>this should be possible. On 32 MHz CPU speed, disk op's should fly...

A 32MHz 68000 with zero-waitstate DRAM access works quote nice - it was even
a good bit faster than my PAK-3 (with 2nd-level cache, but without fastram).

>5. DMA chip
>
>Does someone know specific things about it-like timings and protocol on
>it's ACSI port ?

It's in multiple publications - in German eg. in the 'Profibuch', in Claus
Brods 'Scheibenkleister' and IIRC in multiple articles on old magazines.

>6. Video Shifter
>
>From what I know about it, it could be easily realised in the CPLD, if
>it

Why would you want to do that? The shifter knows nothing about memory
addresses etc. (look at the signals it gets), so there should be no need to
exchange it.

I have been using Everest as an editor for NEWSie, and can save clips
to the clipboard fine. Alternately, I can also use it for the viewer,
but then I have to save binaries to decode them instead of having the
luxury of decoding them within NEWSie.
What made me think of this was when a Web site is refered to in a
news item or mail and I thought I would be nice to just paste it to
CABs open URL dialog box. With a little sliding, I can still see the
address in the mail with CAB running in the foreground:).

Thanks,

Mike

Now, this is a fine opportunity for me to talk about my current project, which is TextView!! and the StringServer ;-)

The StringServer is a small server that sits there, waiting for a AES message containing a string. This string can be any string. The StringServer is configured with a "string mask", "precedence", "filter" and "destination". Now, let's take an example;

If the string maks is "http://*", precedence is empty, filter is empty, and destination is the environment variable BROWSER, then any strings that match this mask will be sent to whatever application that BROWSER points to. If this application isn't already running, StringServer will start it. If the string mask is "www.*", precedence is "http://", filter is empty and destination is BROWSER, the precedence "http://" will be put in front of the received string and sent to the BROWSER application.

The StringServer can be configured to anything you want, you can direct the strings to any application understanding VA_START, a disk-file, or a application pointed to by a environment variable.

TextView!! is just a textviewer that supports this StringServer, which I use as an external viewer in NEWsie. This enables me to just click any URLs, FTP addys, mail addys or whatever to have the corresponding application started. Nice, eh ;-)

The current status of this project is that I have a working StringServer, TextView!! is ready for release, but I'm still not done with the ConfigSS program, which is used to configure the StringServer. Any day now, tho. (hopefully)

This software will be released as shareware, fee not yet set. Any comments/suggestions about this software is highly welcome.

Take care.

Why is it that if I use a disk clipboard in QED, everytime I use the clipboard, NEWSie thinks I've saved and quit and am ready to send? Meanwhile, QED is still sitting there with my unsaved message. As a result, I have to use a 'soft' clipboard in QED. Not a big deal, but sometimes the disk clipboard comes in handy.

I know that. I have already built an DRAM expansion for 68008 (extra 2Mb for
QL) and for 68000 (some board that I used to play) and agree that 0WS dram
expansion is very elegant and cheap within reasonable frequencies. But I'm
thinking along the lines of using 16Mb EDO SIM (well, only 12 or 14Mb-if I use
address space of old TOS also) and with new MMU unit that would give me somewhat
broader address range of all internal address pointers (video,dma) and MUCH more
bandwidth.

I don't quite believe that. I checked that many times. OK, so it is not right on the spec. to the last ns- with ST's CPU clock it can not be easilly done, but it is certainly close enough.I also tried all tricks in the book (varying waitstates, slower rise/fall times to avoid ringing on the cable etc., even varying CPU clock) but problematic drives persisted not working. A friend, which has developed QUBIDE electronics (QL's IDE card) told me about tons of problems that software driver writing team had with differently acting drives.

Great ! I think I could dig up its datasheet. Do you have a schematics to wire it? It would be nice to have at least one thing without writing drivers. Not ideal solution, but worth having a look into.

Actually on my bench i have plain old NMOS 68000-10MHz in wirewrapped 520ST's board. Thing is running on 25MHz. I took almost everything else from the board (but the CPU, of course) and realised the decoder and several other signals with a few GAL's.I have there 64 Kbyte of EPROM, 64 Kbyte of SRAM and one I/O port.(I use it to study undocumented behaviour of 68000.)
I'm assuming that modern 68EC000-FU20 could run much faster- i think 32MHz is only conservative estimate.

If one could ellegantly replace old MMU with new and achieve higher bandwidth,
it would be sensible to use it to achieve higher resolutions and color depths.
Although it is possible to use existing shifter at somewhat higher frequencies,
it would seem more appropriate to make something better with CPLD...

Thanks,

Branko

Good question, and one that has been asked by others. NEWSie waits
for the editor application to terminate, or the current application
window to close before re-introducing the "Send" dialog. I don't know
what QED does in its clipboard processing. And I don't have QED to
test with.

It might be possible that vt52 might be getting keystrokes which
should be going to other processes or there's a glitch whereby it
leaves a character behind which it keeps seeing over and over again.
When it's playing up, try pushing the window to the back (some other
process should get them then) or toggling pre-emptive multiasking
on/off (if its a glitch it could well allow the char to be removed).

Oasis builds its commandline in its executable and when MagiC is
running it manages to come up with something like the following ...

DD:\OASIS\NOS.TTP STARTUP.NOS

... yep, every single time it puts in 2 drive letters - it ain't a
typo! I did try to hack my own command line into the executable but
the above still prevailed. Possibly they used shel_read() - I know of
three different results this aes call can return.

Thus, we only have one conclusion. It checks nos is there before
building the command line and executing it, hence the discrepancy.

>>Whenever you want to go online, exit Oasis then hit your keyboard

>no reason to load Oasis after I'm done. (I'd be using Net2Net

>instead.)

You'll be pleased to hear it can be binned then. I'll just go dig out
some info ...

Okay, the command line to pass to nos is (without quotes) ...

"-d F:\OASIS\ -s 40 startup.nos"

where F:\OASIS\ denotes where the SPOOL directory is.

The only thing you need out of the oasis folder is the SPOOL\ folder &
NOS.TTP & STARTUP.NOS although the DIAL.TXT is usually stored there as
well so grab that. Remove everything else.

DIAL.TEXT typically looks like this ...

```
#
# Sample dialer script for login to Demon Internet Services
#
# replace 'site' and 'password' with your values
#
configure:
init "ATZ\r"
dial_cmd "ATDT"
ld_code ""
#area code iirc
#
number "9549666\r"
number "9549666\r"
number "9549666\r"
number "9549666\r"
number "9549666\r"
#number "01636699666\r"
#number "01716640666\r"
retries 999
#
execute:
init
cwait 1000 "OK"
dial
cwait 25000 "CONNECT" "BUSY" "NO CARRIER"
cwait 60000 "gin:" "NO CARRIER"
wait 1000
send "swampdog\r"
wait 60000 "word:"
wait 1000
send "password\r"
wait 60000 "ocol:"
wait 1000
send "ppp mru=576 idle=2400\r"
wait 60000 "HELLO"
```

... and here's a STARTUP.NOS ...

```
# startup file for KA9Q-NOS ST (DIS Version)

hostname swampdog.demon.co.uk
## obvious

ip addr [158.152.224.11]
## fixed IP? put it here else 0.0.0.0

# Attach the driver to the serial port
# if port 0 slip dev buff mru baud
# --- ---- - ---- --- ---- --- ----

#dom trace on
```

SPOOL\MQUEUE\ holds the outgoing news and emails. The bodies are stored as .TXT and if its email it will be .WRK for the header and .NWK for a news header. All are plain text and are deleted as sent. A .LCK file is a dummy file. It means the corresponding file will not be sent. Unless John has fixed it, there is a bug here - only emails get held, news goes out anyway.

SPOOL\ARTICLES\ holds the incoming newsfeed. A single huge text file which typically gets deleted by whoever is the newsreader after unbatching.

SPOOL\RQUEUE\ memory lapse again - iirc this is for incoming emails but I'm not certain.

Unless I'm very much mistaken the SPOOL\MAIL folder looks like it has only got oasis stuff in it so that can probably be removed as well.

SPOOL\NEWS contains a mixture. The only file in here crucial for nos is NNTP.DAT which contains the list of newsgroups to which you are subscribed. although its a text file the format is rigid so be carful editing it. The rest of the stuff in this folder may or may not be required depending on the newsreader.

Finally, [phew!] install nos singletasking until you're happy with the way it works. Hopefully John has fixed it, but it did have a tendancy to crash in a vt52 window and take out Magic with it. Also, I haven't used Nos in a while so when in doubt check with John for changes.

Here endeth the essay ;-))

3904. File transfer from Win '95 to STFM

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-03 00:00:00 UTC
From: Leo Fleming <NO_SPAM_lfleming@worldnet.att.net>
Message-ID: <68mkt4$5rn@bgtnsc03.worldnet.att.net>
Source record: 14839

This may be a newbie question, but I have read the atari NGs and some web sites, but still I cannot figure out how to get files that I download on my Windows 95 pc to my (very recently acquired) Atari 520ST. I tried formatting a diskette in windows and using it on the ST, but that didn't work. Neither did formatting it on the ST and then using it in win 95. Each machine seems only to want to read its own format. Any help would be greatly appreciated.

A simpler thought, but not for John, would be for Newsie to look at the article/e-mail for URLs and mark it as a link, as in CAB. Then Newsie could either use it's own URL viewer, if it isn't being in a multi-tasking environment. If it is multi-tasking, it could start CAB, or do a VA_START to CAB, with the URL as the command-line.

This would, of course, fail if you weren't actually online at the time, but if you were multi-tasking, you could always go online before you clicked on the link.

>remove this line. This statement is false. The loopback is 127.0.0.1
>and you don't have to set this because it's the default.

Okay, but I do use "ip addr [0.0.0.0]" for a dynamic address,
correct? I was never sure whether it was asking for MY address or
that of my provider's.

>Verify the declarations of smtp gateway, pop mailhost, time server and
>the domain addserver lines. All these may only contain IP addresses.
>The only server you must declare by name is/are the nntp server(s). NOS
>resolves these names only after a nntp kick.

Well, that could very well be my problem, because I'm using names.
Looks like I need to find out what the IP addresses are.

>Note: You'll still have one "Unknown host [0.0.0.0]" line. I don't
>know how this line can be removed however. But it will be a great

You must turn on the HP before your computer or it won't see it.
I can post a hardware fix if you can solder.
HP made a FX80 Printer Emulation Cartridge pat no 22707F, don't know
if you can still get them.

3911. Need help with Falcon upgrade

Newsgroup: comp.sys.atari.st.tech

From: NOSPAM@cs.ualberta.ca
Message-ID: <68okfqhrs1@pulp.ucs.ualberta.ca>
Source record: 14601

Hi everyone.

I'm a falcon user and am looking for a relatively inexpensive upgrade. In order to achieve this, I thought I would do the upgrade myself..

Unfortunately, the cost of installing the 2 1/2" internal IDE drive is too expensive for me at the moment, being a starving student. What I would really like to be able to do is to install a cheap 3 1/2" IDE internally. I hear there are ways of doing this (maybe the power supply has to be removed?).

I don't know a lot about hardware but am willing to learn. What I would really like is a 'Do it yourself' guide for this activity. Can anyone post one and/or mail it to me (use the address in my .sig file)? I would really appreciate it.

Thanks a lot.

and remember, the more explicit the diretions, the better.. since I am a relative hardware newbie (but hey, I gotta start somewhere).

Dave (stuart@cs.ualberta.ca)

Delete that line. It isn't needed at all.
Delete the following also

This should match your ip address
ifconfig loopback ipaddress 0.0.0.0

>
>>Verify the declarations of smtp gateway, pop mailhost, time server and
>>the domain addserver lines. All these may only contain IP addresses.

If you've one take a look at the \spool\nos.log. You'll find the
needed information there.
>
>Yes, and as long as it works, who cares? ;^)

Despite the many bugs of Oasis (not NOS) I still use it. Did you know
that Oasis runs on a Hades.

I would appreciate information for those too. I purchased a used Okidata
OL400e to use with cubase. The hp drivers in cubase print ok, but they
don't get the pages right. In other words, if there are 14 staffs on
the page, it will leave off the last one or two and use another page. I
have tried different margin settings, and have looked in the manual for
a way to print smaller notes, haven't found it yet.

help?

A nice suggestion, and it wouldn't take a lot of time, except scanning
for the various url formats and somehow making them accessable via
mouse click from the article and mail windows.

I will put it "on the list".

Not sure about this. My personal attempts to this sort of thing have never
been successful. There is software out there though. Check out an Atari FTP
site...

To copy a floppy disk, there are disk copy programs around (Fcopy, Hcopy,
DCcopy, etc...) or just drag the DRIVE A icon over the DRIVE B one on the
GEM desktop. It is preferable to write protect the source disk before doing
so, and then you're in for a serious disk swapping session.

>I would also need software that can create a Atari ST format disk in my
>PC's drive.

Yes, there is one called Windows95 :-) Just format a PC 720K floppy. The ST
can read and write these without any problems.

>greatly appreciated.
>

First of all, you must format the disk in double density mode, ie: 720K.
There is an option to do so in win95. The disk must be a DD disk, or a HD
with opaque tape over the HD hole. Beware that a HD disk tricked into being
a DD disk will most likely cause errors and problems sooner or later, but it
can be useful for a one-time transfer.

Another problem that can occur, is that your ST has a single sided drive. In
that case it will only read 360K disks. This was the case for the earlier
520STFMs only. The problem is modern PCs can't format 360K disks, so you're
stuck.

In this case, you have 2 options:

1) Upgrade the ST drive to a PC standard drive. It will be able to use
standard DD mode. There is a pointer to how to do this in the Quick FAQ.

2) Setup a null-modem connection with Ghostlink. All you need is a cable and
the program. The problem is getting the ghostlink program to the ST. You'll
need someone to put it on a disk for you.

Good luck.

Source record: 14842

Hi Leo.

Are you sure that you used double density drives (the only the ST
can read without further modifications) to do the transfer? if you format
the disk on the PC, you should have no problem, but DD disks are rare this
days so if you want to use HD disks, be sure to use a tape to cover the
hole that identifies the disk as an HD one, as Win 95 will not format in
DD (even if you set the DD option) unless it detect the disk as so.
Alternatively you can format the disk on the St, but not with the standard
desktop formatter, but using an application that formats in 100% MS-DOS
compatible way... Kobold comes to mind, but I'm sure there are plenity of
them in the PD/shareware domain...

Hope this helps...

Daniel.

>Each machine seems only to want to read its own format. Any help would be
>greatly appreciated.
>
>
>.Hello hope i can help.There are 2 solutions:

1- Tape the second hole from your diskette to cover it. Then format
it on your atari put in your pc and load your files.Then it works
on your atari.

2-Tape the second hole from your diskette to cover it. Put it in
your pc USE PRG.: FORMAT DISKETTE 720 ! you most find it in
windows 95,format your diskette. Load your files on it put in
atari it works.
Info :
1.44k diskettes has 2 holes 1 for protect 1 for reading 1.44.
720k diskettes has 1 hole for protect.
So if you cover the second hole from a 1.44k it become a 720.k
and you can format it on both.

Greetings from Bonny (bonny@glo.be)

3922. Some Atari ST problems

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-04 00:00:00 UTC
From: Fraser <fraserck@flexi.net.au>
Message-ID: <01bd18df$b9970de0$1f4666cb@fraserck>
Source record: 14844

Hi,

A friend of mine owns an Atart ST which he uses for recording his music. I myself have never dealt with STs before and so I don't know anything about their operating systems. He asked me to come over and help him figure out some problem he was having with it.
His problem is that a program he uses frequently (some music software who's name escapes me at this time...) is no longer booting up in his machine. It gets to a certain point then says something to the effect of "the disk in drive is damaged, or not an Atari disk or connect the hard drive". I just told him that the disk is most likey corrupted and he will have to either get a new copy or see if he can get a program like scandisk to repair the bad sectors on the disk. Anyway, he isn't very knowledgeable on the STs either and so he doesn't have any idea of how to make copies of disks with the ST which is why he has no backup.
What I want to know is - if he can get hold of a new disk - how does he make a backup of it? or... is there a program available that he could use to repair the damaged disks and if so, can I download it from the internet? I would also need software that can create a Atari ST format disk in my PC's drive.

Thanks to everyone for all your help

Fraser

You would think so. ;^) I have no idea what to use. I've tried it both commented out and as outrider.anv.net. I have no idea if either one is working.

>ip addr [158.152.224.11]
>## fixed IP? put it here else 0.0.0.0

Is this for my ISP's address or mine? Mine is dynamic, so I've tried it as 0.0.0.0, but get the following error at startup:

Unknown host [0.0.0.0]
input line: ip addr [0.0.0.0]
Unknown host kitfox.anv.net
input line: smtp gateway kitfox.anv.net
Unknown host kitfox.anv.net
input line: pop mailhost kitfox.anv.net 3

By substituting 0.0.0.0 with my ISP's address, I get rid of those first two lines, but try as I might, I cannot get rid of those last four lines. How do I get rid of the "Unknown host" message?

Many thanks for your time and effort sending your configs and commenting them for me. That was a big help and I appreciate it!

I'm logging on, but can't do anything yet. I'm thinking I need to get rid of the above errors first. But I'm also not sure if it's getting my dynamic address. I don't use a logon script at all in PPP-Connect and STinG. I've tried a limited one with NOS (the logon and password prompts), but it doesn't seem to make a difference.

Who said STinG was hard to set up? ;^)

For hostname you must use the last part (part after "@" of your e-mail
address.
hostname kitfox.anv.net or something like this.

Yes with the setup you use it's normal and can't do any harm.
If you have a "ifconfig loopback ipaddress 0.0.0.0" line you must
remove this line. This statement is false. The loopback is 127.0.0.1
and you don't have to set this because it's the default.
Maybe you've declared some servers by name and not by IP. You see NOS
will try to resolve the name immediately and because during the
startup you aren't online yet, is the DNS unreachable and NOS will
hangs until it has reached the "timeout" which is about 35 sec. After
this time NOS give the above mentioned warnings.
Verify the declarations of smtp gateway, pop mailhost, time server and
the domain addserver lines. All these may only contain IP addresses.
The only server you must declare by name is/are the nntp server(s). NOS

resolves these names only after a nntp kick.

Note: You'll still have one "Unknown host [0.0.0.0]" line. I don't know how this line can be removed however. But it will be a great improvement afterall isn't it?

hope this help

Does anyone know if Atari Falcon can read .WAV samples?

I have a bit of a predicament...I purchased a very new Yamaha A3000
sampler, and it will read just about every kind of file out there.

Problem is that it will recognize PC and MAC files only. Any ideas
how I can get files off the internet via my Falcon and then get
the A3000 to read my Atari created .WAV file?

Besides a lot of the .WAV files are .zip and I don't even have
the correct .zip program to extract these files. I feel scre-wed.
Is there anything I can do, aside from changing platforms?
the correct .zip program to extract these files. I feel scre-wed.

No problem, it is already there! A global clipboard exists in most
Atari TOS, computers. At least from TOS 2.06 and upwards. In some
prorams there are a setting, where you can choose if the program
should use the GEM-clipboard or not. This should obviously be switched
on if you want to exchange data between two programs. In Everest you
do it under the drop down menu SETTINGS, GEM-clopboard ON.

There are also
different kind of CPX-modules where you can define where you would
like the clipboard to be located. One of them is CLIPBORD.CPX.

So all you have to do is to switch on the GEM-clipboard in your
allplications and start cutting and pasting.

Hope this helps you.

> test with.
Well, I think I know the answer to this question: ATARI made a mistake
when first documenting the new AES messages (or the documentation was
correct, but the implementation in AES 4.0 was wrong), thus a lot of
programmers think CH_EXIT (the AES message sent to the caller when a
program terminates) is 80, but it actually is 90 (unfortunately, Geneva
also sends 80 instead of 90 for CH_EXIT). 80 in fact is SC_CHANGED, a
message used to tell an application that the clipboard has changed, which
is sent by qed as soon as you cut/copy anything to the GEM clipboard. I
suspect that NEWSie now misinterprets SC_CHANGED (thinking it means
CH_EXIT) and assumes qed has terminated.

Possible?

Ciao

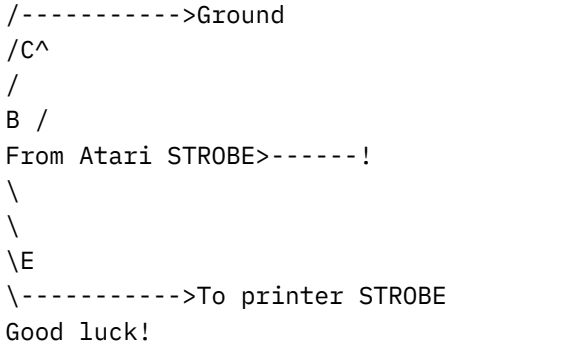
I saved the hardcopy of a post that was on the net a long time ago.
It must have been because the paper has turned yellow anyway I'am
quoteing someone who's name didn't get printed.

"HP Deskjet Plus / Atari ST power-up sequence problem - - solved
I have discovered that if the Atari ST parallel (printer) port
STROBE line (normally high) is pulled toward ground (low) by a
heavy load (such as a powered-off Deskjet), the ST STROBE
line will thereafter stay low until the load is removed (by
powering up the DJ), and until software intentionally sets the
STROBE line high again. (Weird note: the STROBE line has to be
pulled low for something on the order of 1/2 second or longer for
it to stick low -- I do not know why this is.)
Once the STROBE line gest stuck low, the DJ responds with a BUSY
set high. The Atari TOS will not send any data to the printer
while the BUSY line is high -- so no printing can take place.
THE FIX
Install a PNP transister in the STROBE line. This fix is much

simpler than it may seem. Also it simultaneously solves the
heavy loading problem the DJ puts on the the Atari STROBE line.
(Without the transister, the loading on the STROBE line
appears to push it near the 0.8 volt level limit. The Data
lines do not seem to have the same problem, their low levels
seem to be well within limits so no buffering is needed.)
You Need:
- One 2N2907 (or practically any PNP transistor) RS#276-2023
- Access to the printer cable wires for pin #1 (STROBE) and any
ground pin (pins 18-25 on the Atari end, or pins 19-30 on the
DJ end.) I managed to do this inside the cover of the centronics-
type connector or a A/B switch box makes it easy.
Step 1 Disconnect the STROBE wire from pin #1.
Step 2 Connect the Emitter (E) wire of the transistor to the
printer side of the wire/pin#1 split you did in step#1.
Step 3 Connect the base (B) of the transistor to the Atari side
of the wire/pin#1 split you did in step#1
Step 4 Connect the Collector (C) of the transistor to one of the
ground pins (18-25) Atari end or 19-30 DJ end.

Caution: Metal cased transistors often have the case
electrically connected to the Collector-- hence the case
will most likely be grounded -- avoid having the case
touch anything that schould not be grounded.
Step 5 Close up and/or wrap up. Make sure the transistor case
(if metal) and connections are not toching anything they shouldn't
be.



Good luck!

The message <34b0b7aa.0@bonaparte.pixi.com>
from musicman@pixi.com (Vernon L Enriques) contains these words:

> Does anyone know if Atari Falcon can read .WAV samples?

Try SAM! (should have been included with you Falcon - if not, download
it from my WWW pages - this is a newer version anyway...)

> Besides a lot of the .WAV files are .zip and I don't even have
> the correct .zip program to extract these files. I feel scre-wed.
> Is there anything I can do, aside from changing platforms?

Download ST-ZIP from any of the Atari FTP sites (follow the links
from my WWW pages if you dont know them), and this will extract/compress
ZIPs from PC/Mac/unix/whatever.

You are almost certainly right. There is an outside chance it might be
the drive (dirty head etc) but then it would be doing it with any
floppy. I've also seen this happen with an external drive if the cable
gets damaged or not socketed properly.

>and he will have to either
>get a new copy

Probably the only option.

>or see if he can get a program like scandisk to repair the
>bad sectors on the disk.

Unlikely this will work as it would only map out the bad clusters at
best.

>Anyway, he isn't very knowledgeable on the STs
>either and so he doesn't have any idea of how to make copies of disks with
>the ST which is why he has no backup.

Depending on the program it may be that the floppy is copy protected
anyway.

>What I want to know is - if he can get hold of a new disk

If the company has gone out of business then comp.sys.atari.st is the
best place to locate someone who will have an unwanted copy to sell.

>- how does he
>make a backup of it?

If it's copy protected then he can't. It's easy enough to find out
once he's got a working floppy again. Just run a decent disk copier
and if the resultant backup won't work then the original is copy

protected.

>or... is there a program available that he could use
>to repair the damaged disks and if so, can I download it from the internet?

There is something called KnifeST which has a disk repair option. It
will not work on copy protected disks but if you keep trying over and
over it can sometimes read the damaged areas of the duff floppy and
will then make a backup disk for you.

>I would also need software that can create a Atari ST format disk in my
>PC's drive.

Format a 720K disk on the PC, use a DD disk if possible - an uneeded
ST one. Failing that, PC HD disks can be used if you shove tape over
the HD hole to cover it up. These are ok for one off transfers but the
data on HD disks tends to corrupt pretty quickly 'cos the ST drive was
never intended for them.

Hi,

I have an external 1GB Conner SCSI disk connected to my
C-lab Falcon mkII. Is it possible to connect a PC
(with SCSI card) to that disk also ? Or will I get a
conflict of which device is the "bus master", the PC
or the Falcon ? Is there some way to share the disk,
preferably over SCSI without getting a switch box
(cos I can't find any for SCSI) ? I use the latest
version of HD-driver (v6 I think) on my Falcon.

:-)
Mikael

Try using DOS mode only. Press F8 when Win95 is booting up & select DOS prompt
only. This puts Win95 into good old prompt mode. Try formating then.

It is _not_ easy, but if you remove the powersupply it should be possible.

> I don't know a lot about hardware but am willing to learn. What I would
> really like is a 'Do it yourself' guide for this activity. Can anyone
> post one and/or mail it to me (use the address in my .sig file)? I would
> really appreciate it.

Take a deep breath, relax, get yourself a hammer and start working!
What you need:
3.5" harddrive
2.5" -> 3.5" ide cable/convertor (buy one or make one)
Possibly another powersupply - 3.5" drives need more power!
A harddisk-driver, I recomend HDDriver by Uwe Seimet, but it should work
with the latest version of AHDI
2 bottles of beer.

The hardest part is to get that bloody metal shielding out of the way. Why
did Atari have to make the Falcon bullet prood? Actually you only have to
remove the metalshield with the speaker in it. The IDE connector is just to
the right of the powersupply. Drink the beer. Think of a good place to put
the hardrive and connect it. Install the harddisk driver. Have another
beer. Turn the power on. Pray.
If you need the pinouts for the IDE connector just mail me.

Peace!

I remain just a little fuzzy on the difference between modem 2 and
serial 2 on the TT. I just bought a 56k modem and have it installed
on modem 2 with HS modem installed. I cannot get it to function
above 38400 even though the serial CPX indicates some higher transfer
rates are available. Can I just connect it to serial 2 to get the
full speed of the modem or must I make the hardware mod described on
Martin's web page?

You also need to know if you have a single sided disk drive in the 520ST.
Early 520STs only format to 360k. You can still use a prg. to format an
ST DD disk to 360k that can be read by both machines. DC format does the
trick I believe.

Yes, this is possible with a hard disk driver that supports bus
arbitration. You're running HDDRIVER, so this is OK. Note that you have
to provide a unique SCSI ID for your Falcon.

> or the Falcon ? Is there some way to share the disk,

Simply connect all your devices to the same SCSI chain. You don't need
any switch box.

You're right, but how does he get DC Format onto the ST in the first place ?
Besides, modern PC drives can no longer read single sided floppies.

The only way if you have a single sided drive is to either replace it with a
PC one (following Hallvard Tangeraas' descriptions for example) or to use a
ghostlink or Parcp type connection with some getting another atari user to
copy the connection software onto a floppy.

> CH_EXIT) and assumes qed has terminated.

This was changed in Geneva 006 (it now sends 90 for CH_EXIT).
Unfortunately, NeoDesk still relies on 80, so when it receives SC_CHANGED
it thinks some application has terminated incorrectly and puts up an error
alert. Choosing a value of 80 for SC_CHANGED (or anything <256) was a bad
idea, IMHO. A sort of undocumented agreement was made early on in the
development of MultiTOS that numbers <256 were supposed to be reserved for
Atari's use.

This message was really not all that necessary anyway. The SH_WDRAW
message could have been used instead. While it's not as specific (it tells
an app that a particular drive, not just the scrap folder needs to be
updated) the difference is minor enough not to matter to most desktop
shells.

Hi,

I believe that the steinberg & soundpool FDI's are the same. If something works with one, it should work with the other. There is a 16 to 24 bit upgrade for the older steinberg FDI's available but this should not be necessary for your purposes.

The higher speeds on Modem 2 are 'non-standard' and will not be
detected by most modems. There is a h/w mod., as you mention, which
corrects this.

Serial 2 (which I use at 115k2 quite happily) has 'standard' speeds
above 38k4 so should be able to drive your modem with no trouble. You
will need to change the config. of HSMODEM, of course.

Is it possible that one can't use the full speed of the 56 k modem?
Here in Belgium almost everyone (pc-guys) is complaining they can't get higher
then 44.000 of something similar. Personaly I think the ordinary
phoneline just can't cope with this high speed.

> >>copy the connection software onto a floppy.

You can format a single sided 360k floppy on a PC in DOS with the command:

format a:/f:360/u

Or, you can format a single sided 720k floppy on the PC with:

```
format a:/f:720/u
```

>phoneline just can't cope with this high speed.

There are certainly a lot of factors involved, but phone line quality is
probably the most important. Also remember that 56k modems are asymmetric;
the uplink goes at a maximum of 33.6kbps. In the US, the FCC also limits
power output on the phone lines, etc., effectively limiting downlink speed
to 53kbps. The ordinary phone line is *supposed* to work fine at these
speeds. A standard voice-grade phone line is after all a 64kbps full-duplex
link, internal to the telco network. It only gets converted to/from analog
at the final switch before the cable to your house. If you're using ISDN, it
doesn't go to analog until it goes thru your ISDN telephone. The problems
of course are with older analog switches and worn out cabling...

3953. Silly question about empty socket in STE.

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-08 00:00:00 UTC
From: Werner Domroese <werner.domroese@pba.nl>
Message-ID: <69292n$6ln@news3.euro.net>
Source record: 14547

I once had a 4Meg 1040 STE - or should I say 4160 STE *sigh* (which was later replaced with an Atari Falcon030 and later again complemented with a 1040STF).

In the upper-left corner above the SIMM banks and right and below of the PSU, I noticed an empty socket. What was it for? Could a plain 1040 STE have a FPU fitted just like a Mega STE? It was somewhat shaped like the 'new' 'improved' 'non-DIL' version of the 68000 that Atari used in the STE.

Also, does anyone know the correct functions of the DIP switches in Mega STEs?

3954. httpd for KEMD

Hi,

Supposing I have correctly installed KEMD rev2, how can I install an httpd
for my Falcon030 ? I would like to hear from people who done this before,
which version I need, where they got it and what troubles to expect. My
final goal is to connect an ST or Win'95 PC to my Falcon with the Falcon
functioning as Web server and the other side as client (all locally).

Has anyone tried this before ?
What connection do you use (null-modem, modem, PPP, etc.) ?
How did you configure the client side (hosts-file?) ?

I will be very grateful to those who hold this wisdom,

As far as I recall, only 2 of them are used, and I think they are the high numbers,
i.e. 7 and 8.
One has the silly function of cutting the DMA sound...
The other one informs TOS of the presence of a high-density floppy. Then, the
format menu shows an extra option "High density".

Cheers.

Roland

If you encounter any problems due to W'95 writing VFAT files (long filenames)
on your floppy disk, check out :

http://bewoner.dma.be/Septimus/download.htm

From this page you can download Win95Fix beta, which repairs disks that are
'infested' with W'95 hidden files (these hidden files may confuse your Atari
programs). Go ahead, it's free !

Any suggestions about this little fixer are very welcome.

There is a file "DMA.TXT" that contains some notes on how to interface the DMA port, drop me a line and I'll mail it. Apart from this, the only documents I've found is some papers from the "Atari Dev kit" documents, they are pretty rough.

Regards.

If you have a working connection then it's just a matter of downloading
a http-daemon (I've only tried apache) from one of the popular MiNT-sites
(like funet of fu-berlin) and installing it. Apache has a couple of config-
files that has to be tuned, but nothing difficult.

> What connection do you use (null-modem, modem, PPP, etc.) ?
> How did you configure the client side (hosts-file?) ?

Ahhh, you *don't* have a working connection... With KEMD installed it's
not difficult to get a working connection as everything is already
installed.

To get a working ppp-connection you need to do the following:

1. Edit /etc/resolv.conf, /etc/host, /etc/hostname and /etc/domainname
according to your setup.

2. Edit /etc/ppp/options and /etc/ppp/options.ttyb.

3. Edit ~root/.chat-script.

4. Run pppd.

It's quite a few files to edit, but they're very small and IIRC there's
examples in KEMD.

I suggest you read the docs for MiNTnet and pppd, it should give you all the
info you need.

>input line: pop mailhost kitfox.anv.net 3

You can actually replace the names with addresses but this will set you up for future problems if the address changes. This is why names are used. It allows the ISP to fiddle around at their end without it affecting yours. A complex example for instance (but don't memorise it, the facts aren't important) ...

Demon email gets stored on "machines" called punt-x.demon.co.uk where 'x' is a number denoting the machine and your mail is scattered across them. Thus to obtain all your mail you must connect to each punt that does in fact have mail for you on it at the time.

There are two front-ends we can see, one for pop3 known as sdps.demon.co.uk and one for smtp mail delivery known as smtp.demon.co.uk.

With smtp mail delivery (which probably does not apply to you) Nos does not connect to the mail server, it waits for the mail machine to connect to it. Thus Nos "listens" for an inbound mail connection. Problem is, the mail machines are the punts. Even if you used names, you'd have to know the name of each one and tell Nos to listen for each one. Worse, there is no way for Nos to know how many punts Demon have running at the time and with smtp mail delivery the punts can and

do connect at the same time. smtp.demon.co.uk is the front end for this. Nos just listens for *it* - but smtp.demon.co.uk does not actually exist in anything other than name. ie when Nos sees smtp.demon.co.uk connecting it is actually one of the punt addresses.

Less complex is pop3. The connection works the other way round with Nos connecting to sdps.demon.co.uk but in this case sdps.demon.co.uk does exist but all it does is access the punts for you.

Similarly, news.demon.co.uk is just a front end for a cluster of news machines. When Nos connects to news.demon.co.uk the server decides which of the mail cluster machines is best able to serve you at the time and returns its address to Nos.

So, if at all possible, use names for everything except the DNS (Dynamic Name Server). You have to use an address for that because it's the machine that translates names into addresses!!!

>By substituting 0.0.0.0 with my ISP's address, I get rid of those
>first two lines, but try as I might, I cannot get rid of those last
>four lines. How do I get rid of the "Unknown host" message?

Don't worry about it. Nos tries to resolve those names into addresses and fails because the connection is not yet established. iirc, these should go away after a successful connection to each is made.

>Many thanks for your time and effort sending your configs and
>commenting them for me. That was a big help and I appreciate it!

Goody!

>I'm logging on, but can't do anything yet. I'm thinking I need to
>get rid of the above errors first. But I'm also not sure if it's
>getting my dynamic address. I don't use a logon script at all in PPP-
>Connect and STinG. I've tried a limited one with NOS (the logon and
>password prompts), but it doesn't seem to make a difference.

Best place to start is to see if the connection has been established. I've not got access to the ST online any more but if memory serves you should type in the following ...

ifconfig sl0

ie IFCONFIG SLzero all in lowercase

which should result in a whole screen full of info. The place to look in at the entry which starts with LCP and check to see if it says "opened" (yer ok) or "waiting for remote host to attempt open" (yer not and need to fiddle).

>Who said STinG was hard to set up? ;^)

Kerstin Hoef-Emden wrote:

> Modem 2 works with weird bps-rates from 38400 bps on upwards. Usually
> modems don`t support these speeds.

They support this (and higher speeds) regarding the connection from the
modem to the computer. For example, my old ZyXEL modem supports a baud
rate of 76800 baud between my TT (Modem 1) and the modem. It makes sense
to use this high rate because most modems compress their data and so
they profit from it.

>Thanks.
>David

Hi David,

YES, the Steinberg FDI works with Emagic's LOGIC AUDIO (not Logic regular). If you have Logic-regular, and not Logic Audio, let me know and I'll email you the web address where you can download Logic Audio for free - but you must have some of the files and the LOG-3 dongle (that come with Logic regular) to make it run. The Steinberg FDI is the same as the Soundpool FDI. My Steinberg FDI says "produced by Soundpool" on it. Good luck.

Source record: 14645

Or you could add a 'new' drive with the driver.sys (I don't know if it's still included with win95, if not you could try modifying drivparm= and start up using the Start-Up menu by pressing F8, then use Shift_F8 and process everything but the GUI) file in config.sys
that adds a new logical drive for the 3.5" A: drive with a new drive letter, say H:, to just type in FORMAT H: to format it with the parameters defined. Those can include support for one drive head as well as multiple, the number of sectors per track, the number of tracks per drive head (e.g. if you specify one drive head you'll format single sided), etc.

To avoid 'invalid paramaters for this or that drive' type of errors, be sure to experiment with different form factors (/f:<0-7> this is something else than the /f: of the format command). Get an old DOS 3.3 and 3.2 manual for the correct syntaxis of parameters. The most flexible are the rarely and sometimes even undocumented tape drive factors 5 and 6.

Alternatively, install a TSR that allows 'DOS' to access ST formmatted disks. I believe there are some out there. They also allow you to format greater capacity disks under the DOS/Win95 environment.

>You need the 68881 in a Mega STe with a PAL chip. Once you install these,
>the only difference you will see is with programs with Math Coprocessor
>logic built in, there are very few of these programs.
Mostly some rendering packages and spreadsheets, right?
Anyway what I've always wondered....

Unlike the Wintel platform, Apple Computer discovered - or so I've read somwhere - that a math coprocessor or FPU _DOES_ increase *overall* system performance on their Macs (also mainly Motorola systems).

What I've been wondering is why OS enhancements for our Ataris don't seem to be using any FPU power that's present. If really could help to say, speed up some graphics, then wouldn't it be logical to include support for it in NVDI? And wouldn't it be logical to include support for an external PMMU, such as the 68551, if one had a 68020 installed, by stuff like VRAM?

I know of a game that -apparently- utilizes a 68882 in a TT, 'cause when I try to run Epic (published by Ocean Software) on my Falcon it detects a 68030, has support for it, but will ONLY run if I install a 68882 in my Falcon, even with Backward. Very curious about this stuff. Hmmm come to think of it... Why hasn't anyone ever finished or enhanced the Virtual PC software "SoftPC" (software based 286 PC emulator) from Insignia Solutions.... It too used both a 68030 and a 68882 and was to be bundled with TT's until Atari had an argument with its creators. Now they have SoftWindows and thelike on Powermacs... And why hasn't someone ever written something along the lines of Backward for the TT.. or a Milan or an Eagle or a Medusa, for that matter.....

Hmmmmmmm.....

3972. Re: httpd for KEMD

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-09 00:00:00 UTC

Hi,

>Hi,

>Supposing I have correctly installed KEMD rev2, how can I install an httpd
>for my Falcon030 ? I would like to hear from people who done this before,
>which version I need, where they got it and what troubles to expect. My
>final goal is to connect an ST or Win'95 PC to my Falcon with the Falcon
>functioning as Web server and the other side as client (all locally).

>Has anyone tried this before ?

Yes, but some time ago. I'll try me best to remember what I did.

Firstly you will need to download the httpd archive. You will find
this at:

ftp://atari.archive.umich.edu/atari/Mint/Network/httpd-1.3.tar.gz

Unpack this file in the root directory so that the files are unpacked
into the correct directorys.

Once you have done this, the first thing you will need to do is rename
all the .con files in the /var/httpd/conf directory to .conf

Then, load the httpd.conf file into a text editor and configure the
settings to suit your system. You will need to change the line that says
ServerType standalone to ServerType inetd, so that the httpd deamon is
started by inetd (which should run on bootup). You may also want to
alter the other config files, but I found that they were fine on there
own.

You will then need to edit the /etc/inetd.conf file. Edit the line that
deals with http so that it points to the httpd deamon.

I think that was all I had to do.

>What connection do you use (null-modem, modem, PPP, etc.) ?

To make a connection between the client and server (SLIP via a null
modem cable) I used the slattach utility:

slattach -t /dev/modem2 -r remote_ip -l local_ip &

Where remote_ip is the IP address of the client, and local_ip
is the IP address of the server.

>How did you configure the client side (hosts-file?) ?

On the client side, I used the STiNG package (TCP/IP Layer)
and CAB as the WEB Browser.

>I will be very grateful to those who hold this wisdom,

I hope this helps,

Regards,

Ben Hills.

After starting the tread TT modem and getting all the help how to
connect the modem to the TT, I bought a faster modem and connected it
to the serial 2 port. The modem has also voice and fax capability's.
Now my question about the latter. Does anyone know if there is still
a program that makes use of the Class I fax commands? The only one
that comes to my mind is STraight fax. Is it still available? Any
alternatives?
Thanks in advance

FIRST THE SOFTWARE:

1. MIDI QUEST 3.0 $15 (Synthesizer sound editor) I have file list, will send upon request;
manual available. 2 original disks. The software comes compressed.

2. TRUEPAINT V 1.02 $18 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color.

3. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

4. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon).
Needs Multitos.

7. LDW power: Excellent spreadsheet program. It makes all the files you create with
this software compatible with the Lotus 123 format (has acc/prg. covert utility)
$ 2.00 no manual original disk only. (all Ataris).

HARDWARE

1. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $39.
(has original PC software)

2. SCSI II to SCSI II 50 pin cable. Use it to attach your Falcon/TT to and external SCSI device: (The Jazz, a CD rom, etc.) 2 feet. $15.

3.Atari PS for external Disk Drive $10

4.external PS for the 520ST

Free stuff (with the buying of any of the items :) :

- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.
-Falcon F-16 fighter simulator
-STOS the game creator
-Lure of the Temptress
-Jaws of Cerberus
-Knightmare

-Space quest 3

If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US priority mail. (if you are in the US; I am willing to send abroad also) Regards,
Phil.

3977. 1040stf power supply

Newsgroup: comp.sys.atari.st.tech

I have two 1040stf's and both of them are beginning to have problems. I am suspecting the power supplies, as people have told me in the past that most of the problems originate from there.

Machine one powers up great, but tends to freeze up after about 5 minutes of use. The screen just freezes.

Machine two will be working great, but all of a sudden will blank out, as if power has been shut off to it. I manage to get it running again by playing with the power cord on the back.

If anyone has any past experience with this please let me know. Also, if anyone knows someone that fixes these things I would appreciate that information also. Thank you for any help. Please email directly to me as I do not get much time to check back at this group.

Format the diskett on the PC. Make sure to use only DOUBLE DENSITY
DISKS, 720 kB. This should work fine. If you have TOS 1.4 or higher
you should be able to also format the disks on your Ataria.

Good luck

>
The Atari file format is the same as the PC DOS format. Due to a bug
in earlier versions of TOS (< 1.4) disks formatted on the Atari will
not be read by a PC but a disk formatted on the PC can be read by the
Atari. So, to be sure, format the disks on the PC. Then you can
transfer files between a PC and the Atari. This also implies that you
can repair the diskett on a PC, if you have the software for disk
repairs. There is a very good software for diskrepair, backing up,
defragging on the Atari. They are Diamond Back and Diamond Edge. They
are commercial but worth wile the cost. A hard disk is needed of
course. The software is developed by Oregon Research,
http://www.teleport.com/%7eorres/.

I hope this is of help

Now, from all responses in this thread emerged an even crazier idea in my
head :

Would it be possible to connect TWO clients to the Falcon server ?
E.g. one Falcon/PowerBook to the LAN port and one PC to the modem port.

Theoretically I think it's possible, but there may arise conflicts between
the drivers for the ports, no ? It's also perfectly possible that this works
just fine. If anyone has attempted THAT before, please let me know.
(I certainly will try it when I got KEMD fully installed)

Yes, it can.

: Problem is that it will recognize PC and MAC files only. Any ideas
: how I can get files off the internet via my Falcon and then get
: the A3000 to read my Atari created .WAV file?

There's a shareware program called Five-to-Five and it can converts many sample-formats to many sample-formats. It is perfectly capable of reading and writing out .WAV files (beside .AU, .SND, DVSM etc.).

There is also a very tiny but good-enough .WAV player for the Falcon. It's a TTP which plays a .WAV and the exits. I think it's called PLAYWAVE.

: Besides a lot of the .WAV files are .zip and I don't even have
: the correct .zip program to extract these files. I feel scre-wed.
: Is there anything I can do, aside from changing platforms?
: the correct .zip program to extract these files. I feel scre-wed.
: Is there anything I can do, aside from changing platforms?

Don't change platforms. Just download ST-ZIP.

You should find all these programs at the known ATARI FTP sites, e.g. :

ftp://nic.funet.fi/pub/atari/
ftp://src.doc.ic.ac.uk/Mirrors/umich/atari/

If you have Web access, I suggest you use the following :

http://www.shareware.com/

Select "Atari" in the pop-up menu and fill in the name of one of these programs.

If you still don't find these programs, then contact me by e-mail. I have all these progs (somewhere) and will send them to you.

Good Luck !

Yes, I briefly used the REALTIZER about 9 years ago. It worked on a 520ST with TOS 1.0, It is a very old digitizer. It worked not too badly for the time. I have an Animation of me getting hit on the head with a rock followed by lots of stars and my eyes getting blanked out;-). I would be very surprised if it worked with a falcon. Actually come to think it must have been 11 years ago. I would be surprised if it worked on an STe:-). It does work on a Mega ST with Tos 1.02 as well.
Oh yes the Print Technik doesn't do animation, we just used the pictures for the background. Sorry for any confusion.

I have a 520stfm with 4 megs (Xtra-RAM Deluxe) running TOS 1.00. How can I configure Hmodem in order to connect using STing to my ISP?

E-mail to smithjd@geocities.com would be appreciated if you know the answer, or just post here.

Thanks,
James

This happened to my machine for a while. I opened it up, checked all
connections and replugged the keyboard, and it works fine ever since. No
idea what it was. It doesn't sound like a PS problem to me.

Except replacing the PSU, I can't see really.

I always understood, that it was a bug in MS-DOS actually, that does not perform as it should. Something to do with serial number bytes in the boot sector.

Yeah it is really easy. Just connect it to your host adaptor. Set the SCSI ID on the back to either 5 or 6. and than boot your system. The computer should see the zip drive at that point. You will need to format the zip using either ICD format utilities or something like HDDriver. The latter program is probably the better. If your machine does not see the zip drive at this point it could only be a few reasons.

1> bad cables (scsi ribbon)
2> no terminal power (5 volts) on the scsi cable. This is important as some drives DO NOT supply this termination voltage.
3> Your host adaptor does not support the zip drive. Use the Link2 or something simular.

I have been using scsi zip drives on all of my ST's and STe's for sometime now with no problems at all.

Mega STe with 4 megs-ICD link2-1.07 gig hard disk-scsi zip drive-scanner-TI MicroLaser+ Laser printer/HP540 color printer

also using PaCifiST the ST emulator for the IBM (what a great program) finally something good to use on the IBM.

Beware of a couple of other things....the ZIP isn't a bootable drive as far as the ST is concerned, the EZ135 is, probably the main reason Atarians were the only people who bought EZ135's AFAICT.....

AHDI (If you use it) will need the ZIP to be next in line after your hard disks etc, if there's a gap (or a tape drive) in the middle, AHDI will stop at that opint and only let you access the drives from 0 - the gap.....This program will soon leave the boot sector of my Falcon forever for just this reason.....

>
>I have been using scsi zip drives on all of my ST's and STe's for sometime now

Look out also for the Nomai 750....you should get it for not much more than a ZIP but...it will use EZ135 and EZFlyer carts as well as D2 and Xyratec 540 carts as well as it's own 750 MB carts, and it's a lot faster than a ZIP, with a more complete SCSI spec (iwe it is bootable)

There's no need for configuration really, just make sure the programs are in
the correct order in your auto folder. The correct order is:

DRVIN.PRG, then MFP.PRG, then STING.PRG.

To make sure they are in that order, copy them to some other folder, erase
them all from the AUTO folder, then copy them back one by one the way they
should be.

Why is that crazy ?? Every decent TCP/IP stack should do that easily. STinG
does it very well, and so does MiNTnet too.

BTW.: There is a very nice HTTPD (web server, whatever you wanna call it)
for STinG too, and it's incredibly easy to set up. Look at my web page to
download it.

Hmm... in the original review of the ZIP by ST Format they said one of its
disadvantages was that it wasn't bootable. I repeated that, if you have got one
booting then I withdraw the statement. My apologies...

Highlight a drive ICON (any of them) click on Install Icon in the Options
menu, change the drive letter to the drive letter that you want to use for the
Jaz, then change the icon to whatever Icon you want to use for the jaz and
click <OK>. Repeat for as many partitions as you have on the Jaz....This caught
me out the first time I put a CDROM on my ST.....T.

In Pacifist under W95, you can do a copy'n'paste of Pacifist in full screen
mode by doing Alt+PrintScreen or Ctrl+PrintScreen (can't remember which).
Then you can go and paste it into your favorite picture printing program.

Hi,

>Does anyone know of a way to make an Iomega Zip Drive work on an atari
>1040 STe?

>Thanks for any help...

Yes. The SCSI version of the ZIP drive will work on an STE, but you
will need to also buy a SCSI host adapter. The Host Adapter sits
between your Atari and the ZIP drive and converts the SCSI data
into data your STE understands.

You will also need a driver for the ZIP Drive. HD Drive supports
ZIP Drives.

Regards,

Ben Hills.

AFAIK it's not possible to use both SCC-ports (Modem2 and LAN) on the
Falcon simultaneously, but you could wire out the MFP serialport (Modem1).
It's restricted to 19200 or 38400 though.

FYI there are at least two programs at various ftp sites that will
configure AHDI
so that you could have a SCSI id at 0, and the zip at SCSI id 6, and it
will be no
problem, AHDI will see both drive. One of these was written by the
indomitable Uwe
Seimet, author of HDDriver.
Look for a prg like ahdiconf.

This one sounds the same as most of my psu problems. If so, it will be
a dry solder joint(s) on the psu. It can be fixed temporarily by
running a soldering iron over the offending joints (can be hard to
find). In my own experience though, by the time this problem arises,
components have usually been badly heated and will begin to fail 2 or
3 months after. Usual psu precautions/warnings apply of course!

Another possibility is the power switch. They are cheap 'n' nasty. You
can usually tell this problem because of crackling noises when you
switch it.

The MagiCPC demo works fine under NT4. The demo only runs for a few
minutes at a time before you have to quit and restart it but that
should be long enough. Even better, it doesn't leave bits of itself
all over your hd - just delete its folder and its gone.

The PC requires a couple of entries in the bootsector (can't remember
details) be set to specific values otherwise the PC rejects the disk
as unusable. As these entries are irrelevent as far as accessing the
data on the disk is concerned then imo it is more correct to consider
the bug is within the PC than within the Atari.

Now wasn't that long winded? ;-)

Hey fragmentk!?! :-) What midi unit? Some midi modules (units?) just
accept sysex as is. Others want to "handshake' with other modules or
computers. My Proteus/1 works with any and all midi programs. But my
Ensoniq SQ-80 needs handshaking and other stuff.

IMO, it doesn't make any difference whether it affects accessing the
data, its a simple case of if it was how MS documented it. Without seeing
the docs there is no way to tell who got it wrong.

However the fact that other machines also reject ST formatted disks
suggests that it may Atari's fault...

OK, what am I missing here? I'm trying to convert a big 900k Calamus 1.09n file to Calamus SL. Made certain that there is lots of free RAM and everything goes OK,

...BUT....

Calamus SL is imposing a default text ruler on all 234 text frames in the document. Just about every frame had some adjustments made while in 1.09N during the rough layout phase, so there are hundreds of text rulers buried in there. But Calamus SL wants to impose the 2.0/6.0 default on every frame and the text overflows everywhere.

What can be done to force Calamus Sl to respect the textrulers that I put in there?

Message-ID: <69hk72$u31@news.iwvisp.com>
Source record: 14513

While checking for updates to Web pages I frequent tonight, I stumbled across the Wizztronics page. They state that the Hawk 030 has been put on indefinite hold. What else is new? What caught my attention was their claim to be in the design stages of an (another) Atari clone. I think they have had this idea for sometime, but that wasn't what interested me.

I got to thinking, wow, I have MagiC Mac for my Quadra. It runs about as fast as my A/B'ized Falcon. Not much fun there. I sure wouldn't mind an 060 Hades, and even thou I am not cost minded, there just isn't enough third party hardware to justify the purchase.

Then I though of MagiC PC. I haven't heard much about it, but I suppose it runs about TT speeds. Still not really impressed.

But then I thought, if ASH really wanted to futher their market, why not MagiC Amiga? 060 cards for the Amiga have dropped in cost with the release of the RISC cards. A dealer in San Diego said he could get me an 060 CPU for about $200.00. I think the upgrade for the Hades from 040 to 060 is much more than that. While Amiga hardware is not cheap, it is available and still supported. I'm not sure which models, but some Amigas support the same video scan rates as the Falcon does in RGB mode. Wouldn't that make it more compatible than MagiC Mac for "older" software and games? Or another thought, if the Apple card for the Amiga is compatible with the 060 and Mac O/S 7.6, then shouldn't MagiC Mac operate on an 060 equipted Amiga now?

I wonder if any Amiga users have tried the MagiC Mac demo on their emulator card? Ummm, the mine reels.......

Mike

The PC wants to see the correct media descriptor. When it finds the
correct
one it assumes 80x9 tracks for a DD disk and 80x18 for a HD disk, even
when
the sector and track bytes are set to different values. TOS reads the
number
of sectors and tracks from the boot sector and simply uses that value.
It
doesn't care about the media discriptor bytes.

Bye, Hans

Although it's hard to say, it sounds like a 'piping' problem during the SL conversion. Are you using the most recent Calamus SL and its document converter module (DOC_CONV.CXM 7-21-1995)? Try exporting from 1.09N as Calamus Text (CTX) and then import that into a converted SL layout. It's a two-step workaround but it might work. A longshot: check your current text in PKS-Write to see if perhaps your rulers are really there. By that I mean SL might have inserted a default ruler directly after each custom one (ruler on top of ruler, overriding the previous). I've experienced corrupted CDK conversions that lead me to the two-step route mentioned, although I don't recall the ruler problems you have. When the gremlins did strike, I reconstructed things using exported CTX text, sometimes even recreating the 1.09N layouts right from scratch in SL (no conversions).

Hi everyone....
(14 january 1998)

i just bought Magic 5.13 yesterday. I have got a falcon+AB040+16 Mo
TT-Ram (just one simm plugged) And after to installed (with success)
Magic (with the standard install program) i tried to start it.

so problems began....thus, any time i open a window or clic an icon on
the magic desktop, the following message occured (in french cause my
magic is french):

In english: "Bad Aes call 60" (In french: "Appel aes 60 erronee")

I don't understand what's happened :-((

i can just say, that if i move the vertical slider from a window, the
contain occurs, but not the first are displaying at the window's open.

The magic version is 5.13 and in French (of cours for me ;-))

PLEEEEEEASE HELP ME....i don't know what to do :-(((((((

> interested me.

Yeah I have talked to one of the designers and they have been looking at
it for a while. I did also notice that they have come to their sences
and
added industry standard PCI slots to it. First they wanted to add some
jumbo jumbo slots as PCI wasn't good enough for them. Better with "slow"
standard busses than horse shit busses. Maybe firewire could be an
alternative... anyway god knows when/if it will be ready for display.
But I would also like to say that I have much more faith in Wizztronics
than in Centek which just speaks load and dilivers nothing, now if that
means anything as they both has failed to deliver anything yet.

> But then I thought, if ASH really wanted to futher their market, why

Well as Amiga is moving to PPC now I would buy a cheap super duper Mac
clone and run a native version of MagiC on it insteed if I had to. Why
Amiga?

I could be 100% wrong here, but AFAIK while the SCC has two channels, only one is used on the Falcon. You can select which port (modem or LAN) to use by setting/clearing a bit on one of the PSG's 8-bit ports. Sorry for being so vague, but I don't have any docs here.

I don't think this is correct. Both channels are connected and it's the
COMBEL who selects which channel should be selected, or I'm 100% wrong.
As far as I know the PSG has nothing to do with the serial port. It does
handle the parallel port if that is what you are thinking of.

Hello,

Dans l'article <69i5tk$iau@thoth.portal.ca>,
Neil Roughley, <roughley@HORMEL.unix.dsoe.com> a ¤crit :

¤¤Although it's hard to say, it sounds like a 'piping' problem during the SL
¤¤conversion. Are you using the most recent Calamus SL and its document
¤¤converter module (DOC_CONV.CXM 7-21-1995)?

Are you sure there are no most recent version ? I think SL 96 comes
with a doc_conv.cxm most recent, dated of end of 1997 (october may be) - but
it may be only the date of the French version.
A new version will be sold with the next version of Calamus SL (coming
soon, I hope...).

¤ Try exporting from 1.09N as
¤¤Calamus Text (CTX) and then import that into a converted SL layout. It's a
¤¤two-step workaround but it might work. A longshot: check your current text
¤¤in PKS-Write to see if perhaps your rulers are really there.

Or better in Eddie (light) - sold with SL 96. It may allow quick
search and replace and rulers corrections, especially if rulers are not so
diferents.

¤ By that I
¤¤mean SL might have inserted a default ruler directly after each custom one
¤¤(ruler on top of ruler, overriding the previous). I've experienced
¤¤corrupted CDK conversions that lead me to the two-step route mentioned,
¤¤although I don't recall the ruler problems you have. When the gremlins did
¤¤strike, I reconstructed things using exported CTX text, sometimes even
¤¤recreating the 1.09N layouts right from scratch in SL (no conversions).

Evenually, a way would be to change the default Calamus ruler (edit
one without document, and then save preferences), to have one close to the old
ones.

Hi

Is the MagiC install a new one or an update. If it is an update this
is the message you get if the installer did not update Magxdesk
properly. Try just coping the files direct from the master just
Magxdesk related stuff in the gemdesk folder and replace the ones on
the harddisk, reboot and all should be fine.

I had the same problem last time I updated.
Thos can also happen in you do an update and do not reboot and try to
use magic it seems to confuse the info files and cause an AES error ir
wrong AES for the version of MagiC etc...

Hope this helps out also there could be an error in the MagiC.inf
file. Replace this also.
Regards

Hello, Emmanuel

The last version of Calamus SL released in North America is dated 7-21-95. To my knowledge there have been no further updates to this. But Europe has always been different when it came to Calamus and its updates. The text editor Eddie, for instance, was never bundled with Calamus over here. If I want the most recent North American version of Calamus I'll need to run Windows (MGI, formerly DMC North America, purchased the rights). Your French version may indeed be more up-to-date, although the newer datestamps might just reflect the French translations (probably both). John is using the North American version, but which one I don't know (hopefully the latest since SL '93 has more gremlins than the '95 version).

You are ofcourse completely right :-) I can say that I've been mislead by
some bad friends, but the truth is that I trusted my memory, which always
ends with disaster ;-)

I've checked the schematics, and the LAN-port is connected to SCC channel A,
while the serial-port is connected to channel B. Both channels has their
own register, so I guess this means that they *can* be used at the same
time. And yes, it's the Combel that selects channel and not the PSG...

I couldn't remember which bit of the boot sector it is. As Hans's post
sez its the media descriptor (a single byte) then it is MS because by
defining it to be "so", they enforced a scheme which excludes extended
formats. You could argue this is a good thing from a data security
point of view but I'm more inclined to go with the usual reason - they
just wanted to control yet one more thing. Or maybe they just weren't
up to doing the calculations? [smirk]

Hello,

Dans l'article <69jb67$5dh@thoth.portal.ca>,
Neil Roughley, <roughley@HORMEL.unix.dsoe.com> a ?crit :
??Hello, Emmanuel
??
??The last version of Calamus SL released in North America is dated 7-21-95.

Well, that confirms that the date is certainly not only a translation
date... The last French version is dated of 1997, October?; it corresponds to
the Calamus SL 96 version [very characteristic info box, with a nice red 96]?;
the first version I've got of SL 96 was a German one, dated of 1997, January.

??To my knowledge there have been no further updates to this. But Europe has
??always been different when it came to Calamus and its updates. The text
??editor Eddie, for instance, was never bundled with Calamus over here.

Here, it is in the '+' packet from the SL 96 version and in the
standard packet beginning with the next version (officialy... Some standard 96
got an Eddie light instead of PKS).

? If I
??want the most recent North American version of Calamus I'll need to run
??Windows (MGI, formerly DMC North America, purchased the rights). Your

MGI bought rights also of the TOS versions. Invers got the right for
TOS-version developpement and for European distribution.

??French version may indeed be more up-to-date, although the newer
??datestamps might just reflect the French translations (probably both).
??John is using the North American version, but which one I don't know
??(hopefully the latest since SL '93 has more gremlins than the '95 version).

Well, if you have any possibility to command in Europe, it may be
useful to upgrade to the last SL 96 version?: much more stable than SL95, at
least for French release, and many more options very powerful (especially in
help lines and with the inclusion of mask-modul into the standard
frame-module; new file-selector handling long filenames, new printing dialog
box with direct calling of raster generator, page marges, color
separation,...).
You can also wait for the SL98, planned for february if all works
well... Seems very interesting.

Native version of MagiC Mac? You mean RISC based? Dosen't exist does
it? The 060 should execute MagiC much faster than the emulation mode
under RISC based Macs running the Mac O/S. Now that MagiC is running
on the Hades, shouldn't be a compatibility problem on the 060 Amiga.
The is no option for installing an 060 inside a 68XXX Mac AFAIK.
The Mac O/S won't allow it. Otherwise my Quadra would have been an 060
long ago.
Also, while I haven't toyed with the new "G" processor Macs, I have yet to
be impressed with the speed of of the 603 or slow 604 RISC Macs at
work. Nice machines, but the just don't have the grunt to pull the O/S
around. Besides, Amiga sounds more like Atari than Apple does:).

It wasn't a update. But the guy installing it (it wasn't me) suspect
that
he got mixed disks. One with 5.04 and one with 5.13 as the info dialog
says MagiC 5.04a when it realy should say 5.13.

What you are saying is making me more sure that this is the case.

That's the point. There is no PPC native version of MagiC (yet) but it
would be a better choice than porting it to an Amiga IMHO. If MagiC is
mostly written in C it shouldn't be to much trouble and it would be very
fast indeed. Put a few guys on the task and they will have ported it in
a month or two.

> Also, while I haven't toyed with the new "G" processor Macs, I have yet to
> be impressed with the speed of of the 603 or slow 604 RISC Macs at

Well 603 is "crap" and the 604 is nice but the G3 is one hell of silicon
master piece. Imagine a native G3 version of MagiC or MultiTOS for that
matter. It would make your head spin. If they then could add a layer to
handle
old 68k programs which isn't compiled for the G3 PPC it would be a
killer.

Also the Amiga has got the same problem as the Atari. You add so much
stuff to it that it looks like a birds nest and soon things start to
fall apart.

And well, an Amiga is always an Amiga no matter what OS you run on it.

t > The modem recognises the faster speeds from serial 2, but not
t > from modem 2. I am noticing a definite speed increase with
t > speed set to 115,000.

I have been unable to figure out how to get Modem 2 to generate 56.7K, 115.4K or 230.8K, other than to use 62.5K, 125K and 250K and hope for the best. (Sometimes it works, sometimes it doesn't).

I did discover that the documentation on RTxCB and TRxCB is wrong. TRxCB is connected to the 2.4576 Mhz clock (which means that it cannot be used to run the BRG). I don't know what RTxCB is connected to, but presumably it is hooked up to Timer C on the second MFP. It is definitely NOT hooked up to the 3.762 MHz clock.

Well, either Hans or the compendium is wrong... :)

"To create an MS-DOS compatible disk you must first set the first three
bytes of the prototyped boot sector to 0xe9, 0x00, and 0x4e."

I dont know what these bytes are for, but its > 1... and none of them are
the MS default sector sizes.

BTW. The PC isn't quite as inflexible as I had previously thought... I
successfully read most of my old STF and STUser coverdisks (including
those bizarre "single/double sided" disks, and some extended format ones)
at the weekend...

> defining it to be "so", they enforced a scheme which excludes extended
> formats. You could argue this is a good thing from a data security
> point of view but I'm more inclined to go with the usual reason - they
> just wanted to control yet one more thing. Or maybe they just weren't

Yea, could be that. :)

Or, ISTR that the bytes are SWAPPED in Atari's bootsect (never checked, and
thats only a vauge memory... and it doesn't fit with the *3* bytes above...)
which to me implies that its an "endian" mistake by someone.

> >However the fact that other machines also reject ST formatted disks
> >suggests that it may Atari's fault...
>
> or that they have been forced to follow MS? ;-)

Yea, I guess thats a possibility for create, but surely not for read?

4052. Original 520ST RAM upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-16 00:00:00 UTC
From: John Kolak <jkolak@jps.net>
Message-ID: <34BFDE0F.5006CB4F@jps.net>
Source record: 14448

I have been trying to find documentation on upgrading the original 520ST (external floppy and power supply, only one bank of RAM) by replacing the original 256 chips with 1 mb chips. I have an archive from 1989 specifying how to do this on a 520STFM/1040, but the docs talk about cutting specific traces which may not be the same on the different motherboard, and does not discuss what is being accomplished in terms of principles. Does anyone have or know where I can find a similar procedure spelling out the technique with the original 520? If not, a SIMM upgrade addressing the original 520 issue may have to do.

Thanks in advance.

My experience of PCs is quite limited but it seems that Win95 is quite able
to read an ST formatted disc, even if it is of an extended nature. I know
for certain, after several transfers to and from my STE, that Win95 will
read and write to 83x20x2 HD discs. It also uses 80x20x2 HD and 83x10x2 DD
discs. From this it appears that MS have actually decided to use the info
in the boot sector instead of relying on a media descriptor byte.

Hi,

Could anyone please identify the 144 pin square chip to the left of the motherboard. Various numbers are c302183-002/B j9206
MM9283COD-VF6 NK027294A
About 4 of the tiny pins have lifted off the motherboard, messing up the video and stopping the floppy drive from working.It is so tiny that I don't think I can do it with a soldering iron. Is there some technique or is this machine dead ?
Also is there a FAQ which identifies the chips on various Atari machines ?
Thanks for any help,

Regards,

Bill

From: s970707@uia.ua.ac.be
Message-ID: <EMvsu0.LqK@uia.ua.ac.be>
Source record: 14539

Hi everyone,
I'm back with some more troubles. I'm currently trying to install
my Falcon as a small intranet server (2 clients). The final configuration
should be :

- 1 Atari or Mac connected to the LAN port
- 1 Atari or PC connected to the modem2 port

The network will be off-the-internet. It is just for experimental purposes
and demonstration.

Now, some of my questions :

1) In order to create a network, I need IP addresses. So for the host
(my Falcon, called 'razorback'), I set up the following config :

rc.net: replaced the 'ifconfig lo0 ...' line with :
'ifconfig lo0 addr 192.168.0.10 up'

hosts: '127.0.0.1 loopback lo0 localhost loghost'
'192.168.0.10 razorback [+ some aliases]'

Is this correct ? I tried everything and it all (ping, telnet, SMTP, ftp,
imapd etc.) and it all works fine : both for localhost & razorback. So far,
I haven't encountered any problems with this configuration, but will it stay
like that ?

2) I downloaded NCSA httpd v1.3 and installed it as required. I configured it
as 'ServerType inetd' (as recommended by the one who ported it) and when
I open an HTTP connection ('telnet razorback 80' or lynx), it shows smth
like this :

httpd: cannot bind to port 80
bind: socket already in use

and no HTTP connection. I also tried the "standalone" configuration (as
recommended in the NCSA docs), but same error here. I haven't got any clue
about which process could possible have hooked on port 80. Please help !

3) In the KEMD docs, there is a ref to the MintNet docs (not included). Great,
but where do I find them. Also, is there a more recent version of the
FreeMint 1.12.4 kernel and if so, what are its improvements and where do I
get it ?

Thanks for reading anyway,

Use a lot of fluss and a very thin soldering iron. (I work with surface
mounting and that is the trick we use:)
If that won't work - buy yourself a beer - it is probably dead.

t > speed set to 115,000.

I have been unable to figure out how to get Modem 2 to generate
56.7K, 115.4K or 230.8K, other than to use 62.5K, 125K and 250K and
hope for the best. (Sometimes it works, sometimes it doesn't).

I did discover that the documentation on RTxCB and TRxCB is wrong.
TRxCB is connected to the 2.4576 Mhz clock (which means that it
cannot be used to run the BRG). I don't know what RTxCB is
connected to, but presumably it is hooked up to Timer C on the
second MFP. It is definitely NOT hooked up to the 3.762 MHz clock.

Yep. It *is* connected to Timer C on the MFP, but this can be changed.

Not being a Notator specialist I can't tell for sure, but It surely can record sysex just like any other MIDI message (note on/off, modulation, etc...).

The problem more likely resides in the MIDI unit you are using, ans as you didn't state what it was, I suppose we can't be of much help.

MGI Software - Calamus SL 97/98 Upgrade Announcement
==========

Have a great New Year with the latest upgrade to Calamus SL.

We're pleased to be able to bring you this superb upgrade to Calamus SL.
Aside from the usual bug fixes and speed enhancements, you'll find new
features, improved functionality, and some worthwhile interface changes.
Pricing is as follows:

Upgrade from 1.09n = US$129
Upgrade from any S/SL = US$99
Taxes and Shipping are extra.

Orders should be sent to:

Howard Carson
Digital Publishing Products Manager
MGI Software Corp.
40 West Wilmot St.
Richmond Hill, ON
Canada
L4B 1H8

Tel: 905-707-3612 Fax: 905-764-7110
E-mail: howardc@mgisoft.com Web: www.mgisoft.com

Order by Visa or Mastercard via e-mail, regular mail or fax. Be sure to
include the full account number, the customer name on the card, and the expiry
date on the card. Of course you can order with a personal check, bank money
order or postal money order. Call us for exact shipping charges.
*General

==========

This upgrade is an SL97/98 version. It will carry a January '98 file date.

This version will be supplied on High Density floppy disks. Double Density disks must be requested.

Please note that you may have to adjust your custom key bindings to reflect the new positions of some icons and menu items.

Parts of the interface have been simplified and cleaned up. After selecting a 'Create Document' menu option, the 'Page Setup' window is opened automatically. Similarly, when opening a text frame without fonts loaded into the system, instead of an error message you will find the necessary dialog box. These improvements (and the rest below), will spare you lots of unnecessary mouse clicks.

*The Drop Down Menus
==========
The entries in the drop down menus have been altered slightly, reflecting some of the new features and functions.

*File Menu
==========

The 'Format Disk' option has been removed from the File Menu.

*Printing
==========

The Print Dialog has been changed substantially. The emphasis is now on easier handling and better accessibility to all functions related to printing.

Clicking on a field with a border around it launches the function indicated in the title of the field. Note carefully that a triangle in any field marks the location of a pop up menu, where further options can be selected.

Percentage values for rasters can now be set. This value determines the enlargement or reduction factor for the raster included in the document. Naturally, it only makes sense to use this setting when the entire document is reduced or enlarged during printing.

Clicking on the icons associated with this setting calls the Raster Generator module, the Color Separation Module or the LIN Module (FrankLIN Lite, the new module supplied in the upgrade), to set the necessary output linearity values.

The setting for the output of color planes is another interesting new feature. Color separation is activated by selecting the 'Separation' button in front of the field. Clicking on the 'Separation' field itself takes you to the familiar dialog for selecting color plane output. You can get the same results by turning the C Y M K and the + fields on or off. The '+' field represents all other (spot) color planes, so you have all output color planes within easy reach.

Clicking on 'Crop Marks' opens a dialog in which you can set the working area in the frame module. The appropriate selection field activates the actual output of these values.

A click on the 'Montage' field takes you to the Imposition (Mount) Module. Here as well, you can activate the settings from the module by selecting the appropriate box in the printer dialog.

The 'Job List' field works the same way. Both fields are available when the respective modules are loaded.

*Key Bindings
==========

There is a new button in the Key Bindings dialog: 'Save list as text file'. You can now save a list of your own customized Key Bindings as an ASCII file.

*Window Menu
==========

This is a new menu item that replaces the old 'CDK' item. With the 'Next Window' and 'Previous Window' selections, you can cycle through all windows. Please note that open editor windows are also included in the process.

Please note that Calamus is now able to handle up to 24 windows. Naturally, this number depends on your system configuration as well. Under regular TOS versions for example, the extra windows are possible only with the installation of WINX. MagiC and MagiCMac support up to 64 windows.

The list in the lower portion of the menu shows all documents in memory. They can be selected directly simply by clicking on them.

*The Top Module Row
==========

The Top Module Row has been split up and placed in windows. The module bar can be extended in order to increase the number of simultaneously displayed modules. This is particularly useful for users with large monitors who finally can utilize the full width of their screen. To change the length of the module bar, simply click and hold the right edge of the bar. Drag the bar to the right or to the left. The measurements of the bar will automatically snap to the size of module icons. If you want to change the size of the bar freely, however (for example, in order to fit half of an icon in the bar), hold down the <Alternate> key while dragging the right edge.

The modules can be selected as usual, with a mouse click. If you click on an empty module field while holding the <Alternate> key, the 'External Modules' dialog box will open and you can load, delete or replace modules.

The gray area on the left side of the bar is used to move the entire bar. A double click makes the whole bar disappear; only the gray handle is displayed. Another double click restores the bar.

Please note that if you want to record clicks on the top row using the macro recorder, the module row has to topped.

*Iconify Windows
==========

If your operating system supports this feature (i.e.: MagiC, MagiCMac, MultiTOS), you will find a button in the top right corner. With a click on this button, you can iconify a window. This means that the window is reduced to the size of an icon and placed on the lower left area of the desktop. A double click on the iconified window will restore it to full size.

Try looking at the contents of an iconified window with a magnifying glass; you'll find a full, tiny rendering of the Window.

*Flying Dialog Boxes
==========

Another new feature is the 'Flight Corner' in all dialog boxes in Calamus. Click and hold the dog-ear, and you can move any dialog box to a more convenient spot.

*File Selector Box
==========

Both the drive letter and the file type are now selected from pop up menus. The file selector now supports long file names if there is an appropriate operating system. The file selection line is automatically extended when a drive with long file names is selected.

The file selector box also supports multiple file selection. If you hold the <Shift> key when clicking on a file name, it is added to the previous selection. If you hold the <Alternate> key and click on a file name, all entries between this and the previously selected entry are included. This is particularly useful if you want to load an entire font family from its own folder. Simply select the first entry in the list, hold down the <Alternate> key, and select the last entry. All entries in the directory are selected.

*System Module
==========

The System Module has also received a face lift.

The new option is 'Help Message Position'. You can set the distance of the Calamus help messages from the right screen edge. The setting is measured in characters. For example, entering 10 makes the help messages appear 10 characters from the right edge.

This feature is meant for users with menu bar clocks or similar accessories, so that their displays are not obstructed by Calamus help messages.

==========

There ya go.

Regards,

Rich (I don't work for MGI)

>
>"To create an MS-DOS compatible disk you must first set the first three
>bytes of the prototyped boot sector to 0xe9, 0x00, and 0x4e."

I've just been doing some experiments, and for me the above isn't
true. The 0xe9 should be 0xeb and the other two values don't matter!

>I dont know what these bytes are for, but its > 1... and none of them are
>the MS default sector sizes.

They'll correspond with the first 3 bytes in the bootsector. The first
two is a machine code short jump to the boot program. This is called
BRA but like I said my machine only cares about 0xeb, the actual
offset doesn't bother it.

There are two other bytes that do though ... ;-)

Like Hans said, MEDIA (offset $15) has to be correct. For me the PC
would only accept 0xf9 but I haven't been and tried all 256 values of
course!

Oddly, the byte after is the other one, SPF (offset $16, Sectors Per
Fat). The PC insisted it be 0x03 and barfed as soon as it discovered a
common atari SPF value of 0x05.

>BTW. The PC isn't quite as inflexible as I had previously thought... I
>successfully read most of my old STF and STUser coverdisks (including
>those bizarre "single/double sided" disks, and some extended format ones)
>at the weekend...

Another anomally, and a bad one. Mine will accept extended formats as
well but it shouldn't! It can read 10 sectors just fine but take the
number of tracks over 80 and it screws up all its internal
calculations and corrupts the files. It does this quite happily and
silently. :-(

>> defining it to be "so", they enforced a scheme which excludes extended
>> formats. You could argue this is a good thing from a data security
>> point of view but I'm more inclined to go with the usual reason - they
>> just wanted to control yet one more thing. Or maybe they just weren't
>> up to doing the calculations? [smirk]
>
>Yea, could be that. :)

Looks like I've got a point!!

>Or, ISTR that the bytes are SWAPPED in Atari's bootsect (never checked, and
>thats only a vauge memory... and it doesn't fit with the *3* bytes above...)
>which to me implies that its an "endian" mistake by someone.

Not to my knowledge. The BRA thing obviously has to be different
because of the two different processors. While I'm on the subject, I'm
certain I've seen supposedly PC compatible atari formatters chuck 0xe9
into BRA in the past just like the compendium sez to do. I wonder if
something changed in Intel processors at some point? Or perhaps the
Compendium is wrong and everybody just used it unknowingly. Naah,
atari programmers aren't that dumb! :-))

Ought to mention. All these tests were done on a PII under NT4.

>> >However the fact that other machines also reject ST formatted disks
>> >suggests that it may Atari's fault...
>>
>> or that they have been forced to follow MS? ;-)
>
>Yea, I guess thats a possibility for create, but surely not for read?

Looks like there's no exact answers. The closest I can come up with is
this ...

"you can make an atari disk PC compatible provided it has no more than
80 tracks and has 0x03 in SPF, by putting 0xEB into offset $0 and 0xF9
into offset $15"

I suspect matters are worse than that. Methinks the rules are entirely
dependant on the PC's bios. Your's might be more intelligent than
mine. Can't remember what mine is offhand and I'm not rebooting to
find out! It might be an AmiBios - not sure.

Anyone else care to do some tests?

You changed the IP address of the loopback interface. You should leave
it at 127.0.0.1 where it most likely was. So keep

ifconfig lo0 addr 127.0.0.1 up

Use slattach to link one of the slip interfaces to Modem 2. Then give it
it's IP address using

ifconfig sl0 addr 192.168.0.10 up

Now the connection is there. But you still need to tell the machine to use
it. Use the route command to set up a routing table entry that directs all
IP packets with certain destination IP addresses to the sl0 interface.

> hosts: '127.0.0.1 loopback lo0 localhost loghost'
> '192.168.0.10 razorback [+ some aliases]'

You can do this. You should add additional entries for the machines you want
to hook up to your Falcon.

> 2) I downloaded NCSA httpd v1.3 and installed it as required. I configured it
> as 'ServerType inetd' (as recommended by the one who ported it) and when

I've read the docs at some stage, and IIRC the one who ported it recommended
to NOT run it from inetd, but as standalone. This is recommended for other
web servers too BTW.

> and no HTTP connection. I also tried the "standalone" configuration (as
> recommended in the NCSA docs), but same error here. I haven't got any clue
> about which process could possible have hooked on port 80. Please help !

The inetd possibly ?

Cheers Peter

4070. Q: Null Modem cable

Date: 1998-01-18 00:00:00 UTC
From: Martin.Byttebier@ping.be
Message-ID: <885117156_OASIS_@ping.be>
Source record: 14455

He,

From a pc-shop I've bought me a nullmodem cable (D-Sub 9 pol to D-Sub 25 pol).
I was thinking to use this cable to connect a Hades (modem1 port) to a TT (serial2 port). As software I've tried Duet. AFAIK the settings of Duet are good. I've set the speed on both sides on 115200.
I do get on both sides an extra drive letter but as I try to open it I only get a "drive x does not respond etc..." error.
On both sides I'm running almost the same soft
N.AES 1.1.0/MiNT 1.14.6/Thing 1.20/NVDI 4.11/z-control.acc/serial.cpx

On the TT I've 3 SCSI-HD's (1 internal/2 external) and 1 external ZIP-drive making a total of 13 partitions

On the Hades I've one 2.1 GB E-IDE, one internal SCSI-ZIP and one external CD-ROM making a total of 12 partitions.

What's wrong? Can it be that the null modem cable isn't compatible with the Atari? BTW: package of the cable says "IBM XT/AT and PS/2".

Anyone an idea about this?

Hello,

On my Hades I use a Logitech Pilot mouse (Atari/Amiga) but the problem
is that the cable is a little bit too sort. So I bought me in a pc-shop
an mouse extension chord. Alas it seems not to work. I can move the
mouse arrow horizontaly but most of the time not vertically.
Is there something that can be done to solve this?

```

There is a browser named CAB v1.5 that is free! (CAB v2.x is commersial..)
But there is also a french commersial browser named Wensuite and I
personally think that one is the best. But as I said - it's not free...

>But then I thought, if ASH really wanted to futher their market, why
>not MagiC Amiga? 060 cards for the Amiga have dropped in cost with the
>......
>it is available and still supported.

I believe Amiga has been picked up again by someone. But Support exists mainly
in Video software/hardware and even such stalwart amiga developers such as
lightwave (NEWTEK) are dropping the platform. Because Animation and video can
be done so much better on the PC now than the Amiga, the Amiga is strictly
a hobby machine and will slowly fade away by all serious users.

I'm not sure which models, but
>RGB mode. Wouldn't that make it more compatible than MagiC Mac for
>"older" software and games?

Most games made on the Amiga were made on the ST and in many cases the Amiga
games were better, taking advantage of the amigas features while ataris got
stuck with bad ports not taking advantage of the ST features. There are a # of
exceptions of course but this is how I remember it. So why run a good atari
game on an Amiga, when you can run a great amiga game on the amiga:-).

Again, if an Amiga users has a MAC emulator, most good productivity software
is generally better or more stable than the Atari Productivity software. But
indeed, most amiga productivity software was badly thought out crap. So he
could benefit from Calamus etc.

Or another thought, if the Apple card for
>the Amiga is compatible with the 060 and Mac O/S 7.6, then shouldn't
>MagiC Mac operate on an 060 equipted Amiga now?

Possibly, very cool logic.

Have a great New Year with the latest upgrade to Calamus SL.

You're lucky: SL 98 isn't yet available in French :-(

This upgrade is an SL97/98 version. It will carry a January '98 file date.

What you're describing is nothing... And is, in fact, a partial
description of what's new in SL96 version. SL98 brings really much more than
that - especially if you're comparing that to SL95!

Differences from SL96 :
- possibility of setting size of subscript and superscript
- possibility of copying a frame by moving it with the Shift-key pressed
- possibility of having constant-height lines even with different size fonts
- possibility of converting images from RGB to grey, B&W, CYMK,...
- possibility of anchoring a frame directly from the clipboard
- possibility of seeing frame content even of frames outside the page
- new text-style dialog-box, call the color-editor directly
- new dialog for setting rulers paramaters
- Eddie light as text-editor (much better than PKS)
- new raster generator
- new mount module
- ...

(And differences between SL 96 & SL 95 are greater).

>versions use the same font system or are they different.

Calamus was never officially dead on this side of the Atlantic. But it certainly has been a long time between updates! Nathan is still involved but the company is now called MGI. The last mailout I received from them essentially said TOS users should "...go buy a PC..." <g>. Much of the downtime seemed to be spent getting Calamus for Windows up to par with the TOS version (not the other way around). All this time, development in Europe was continuing with newer binaries, and modules that MGI didn't have rights to.

The original CFN font format is the same. Most of the PD ones I use are from GEnie, which at one time had a very large Calamus user base. There must still be a few PD libraries in the UK supplying Calamus fonts? I even remember a CD-ROM that advertised 400MB of them. Most of the ones I use were purchased directly from DMC (MGI). If you really need a certain font and can't find it, buy the PostScript version along with Fonty and convert it to CFN. Most of the PD ones seem to be converted PostScript fonts anyway (with the labour-intensive custom kerning already done in Fonty or some other editor). To my knowledge, very few CFNs are available on the Web, though.

Anyone remember the Vancouver-based Cherry Fonts and their Genus font editor? Ahhh... the good 'ol days, when there was a local service bureau with a Mega 4 attached to a Linotronic imagesetter. The days when the Mac-based design house upstairs used to pop down to get something auto-traced in Avant Vektor because they couldn't match its quality. The days when all hardware references to 'Atari' were taped over so walk-ins would stop asking questions. Because of various transitions, those days are gone -- but what fine memories they were. And Calamus was the source of it all, so I'm glad to see it still with us. I'll be upgrading.

A used 68040 Mac is good value, and most (not all) Atari programs run
fine under MagicMac. MM itself isn't cheap, though.

Still, the Mac may be better value than a used Falcon. And CAB still
isn't as good as Netscape or Internet Explorer, though still quite
usable.

Beware of PowerMacs, though. I run a fair bit of Atari software under
MagicMac with a fast PowerMac (250MHz), but the slower ones (100MHz) can
creak a bit in speed - faster than an ST, but nothing like as fast as a
Falcon. The 040 machines are speedy for Atari work, though not as
satisfactory (still OK) as Powermacs for Mac work.

From: pls@no.spam
Message-ID: <69v6hl$ahu@bcrkh13.bnr.ca>
Source record: 14466

Hi

I have a serial PPP connection between my PC & STFM.

I notices that the transfer rates seem to vary quite a bit, even though the link is hardwired (no modems) & the load on each machine is constant.

eg.

Ftp from STFM to PC.
Prompt off, mget a few files.

Small file (1660 bytes) gets transfered at 0.7 kbtyes/sec.

Larger file (4256 bytes) gets transferred at 1.1 kbytes/sec.

Small file (2070 bytes) gets transferred at 1.6 kbytes/sec.

Large file (365467 bytes) gets transferred at 1.1 kbytrs/sec.

Medium file (8675 bytes) gets transferred at 0.49 kbytes/sec.

The link is connected at 19200 baud.

I setup Ghostlink as a test; & it has a very constant rate (approx 1.8 kbytes/sec).

Not really fair to compare Ghostview (basic transfer) with PPP (lots of overhead) but I just wondered why the difference.

That are the opcodes for a jump in 80x86 code. Much more variations are
possible.

> I dont know what these bytes are for, but its > 1... and none of them are
> the MS default sector sizes.
>
> BTW. The PC isn't quite as inflexible as I had previously thought... I

> at the weekend...

Well, I used the program fdread on MS DOS and I could read all ST
formated
disks, except 11 sector disks. But that program doesn't work with Win95,
OS/2
and Win NT. And also Microsoft is used extended formatted disks to
distribute
software. The problem is in the near sighted OS.

> Or, ISTR that the bytes are SWAPPED in Atari's bootsect (never checked, and
> thats only a vauge memory... and it doesn't fit with the *3* bytes above...)
> which to me implies that its an "endian" mistake by someone.

When you create a bootable bootsector on the Atari you have to put in a
jump
opcode, to get to the bootroutine after offset $1C.

This is the complete list of bytes of a (Atari) bootsector:
Offset Name
$00 BRA.S Jump opcode to the boot routine
$02 FILLER 6 fill bytes
$08 SERIAL 3 byte serial number
$0B BPS Bytes per sector
$0D SPC Sectors per Cluster
$0E RES Number of reserved sectors a medium start
(usually one; the bootsector)
$10 NFATS Number of FATS
$11 NDIRS Max number of files in root directory
$13 NSECTS Total sector count

$15 MEDIA Media descriptor byte (Not used by the BIOS)
$16 SPF FAT size in sectors
$18 SPT Track size in sectors
$1A NSIDES Number of sides
$1C NHID Number of hidden sectors

All 16-bit numbers are in little endian (Intel) format.

Differences to the MSDOS format:
$00 Jump opcode to the boot routine
$03 8 bytes disk name

The first 3 bytes should indeed be $E9, $00, $4E. (Oops forgot).
The media descriptor should be:
$F8 single sided, 80 tracks, 9sectors
$F9 double sided, 80 tracks, 9 or more sectors
$FC double sided, 40 tracks, 9 sectors
$FD signle sided, 40 tracks, 8 sectors
$FE double sided, 40 tracks, 8 sectors

There should be a copy of the media descriptor byte a the start
of the FATS.

Lets hope I left nothing out this time.

Bye, Hans

Source record: 14471

I've finally decided to buy a ZIP drive for my TT. HDDriver 7 is on order from Systems for Tomorrow.

I vaguely remember reading here that a different driver (in my case ICD Pro v6.0.8) could be replaced with HDDriver and the TT could use the ZIP right away (no formatting or partitioning required). Did I get this right?

Also, do I have to worry about anything else? The ZIP drive will be connected to the back of a scanner, which is the only other SCSI device in use. Will it truly be plug-and-play, especially since I may not have to repartition the hard-drive?

Remember if it's an emulator then you can't say "this emulator is that fast." It all depends on the hardware the emulator is running on. I think it would require an extremely fast machine to emulate the 030 at 2-3 times the speed of the TT.

From: mb@tos.pl.net
Message-ID: <JXAUC2P@tos.pl.net>
Source record: 14474

A member of our local Atari user group wants to connect a class 1 fax modem to his Atari ST or Falcon.

I'm not familiar with all the fax software available for the ST, so which software will support class 1? Most software that I've found only seems to include class 2 or 2.0 support.

Someone said here that Junior Office supports class 1, although I tried that without any luck. I'll try it again, I guess.

But what else supports class 1 fax? What about Straight Fax? Or Star Fax (part of the Star Call package)?

Your assistance would be appreciated.

Nope, only the DNS. You may get errors from Nos due to it attempting
to resolve names while offline but these get sorted when it goes
online.

This is basically right. Simply install HDDRIVER as described in the
manual. There is one exception to this rule: If you partitioned your
drive with an old version of the ICD software that didn't support the
Atari compatible partitioning scheme you have to repartition your drive
if it has more than 4 partitions. With 4 or less partitions this is not
necessary.

> I vaguely remember reading here that a different driver (in my case ICD
> Pro v6.0.8) could be replaced with HDDriver and the TT could use the ZIP
> right away (no formatting or partitioning required). Did I get this right?

Not quite. You'll have to use either BigDOS or MagiC 5 to be able to use
the pre-partioned Zip cartridges, as they're DOS compatible. As a rule of
thumb, all partitions > 32 megs which were created on a PC need BigDOS or
MagiC 5, as well as a harddisk driver that accepts them (e.g. HDDRIVER).

Of course, if you're only refering to your existing hard drive: this does
not need repartioning, unless it was partioned with an older version of
the ICD tools which wasn't AHDI compatible. But those who accept some risk
may convert their harddisks with a little utility without losing data.

> Also, do I have to worry about anything else? The ZIP drive will be
> connected to the back of a scanner, which is the only other SCSI device in
> use. Will it truly be plug-and-play

Well, you will a least have to check whether the termination switch is set
to "on" and the SCSI ID of the Zip does not conflict with that of the
scanner. And you may need an adaptor as the Zip comes with Mac-like SCSI
connectors, whereas most other external SCSI devices have centronics-like
connectors.

Ciao

Thomas

FIRST THE SOFTWARE:

1. Pagestream: Complete with manuals $ 25

2. TRUEPAINT V 1.02 $18 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color.

3. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

4. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon).
Needs Multitos.

7. LDW power: Excellent spreadsheet program. It makes all the files you create with
this software compatible with the Lotus 123 format (has acc/prg. covert utility)
$ 2.00 no manual original disk only. (all Ataris).

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female) so you
can plug in to your external ampolifier. No need for pre-amp. It will go with
hayes modem/cable.

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $39.
(has original PC software)

3.Atari PS for external Disk Drive $10

4.external PS for the 520ST $ 8.00

Free stuff (with the buying of any of the items :) :

Free manuals: HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments
Atari falcon AFM; D2D; SAM.
SM 124
Imagecopy 2

Pagestream 2 quick start manual
available
omnires
truepaint
Soft-hard:
- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.
-Falcon F-16 fighter simulator
-STOS the game creator
-Lure of the Temptress
-Jaws of Cerberus
-Knightmare
-Space quest 3

If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US priority mail. (if you are in the US; I am willing to send abroad also) Regards, Phil.

Hi, Thomas

My existing hard drive was partitioned with the older ICD tools (eight partitions on an 80MB drive). OK, I'll have to repartition. I was hoping to do a 'quick' back-up of the hard drive to the Zip. I'll start from scratch... backing-up my small hard drive to HD floppy isn't too difficult.

As for the Zip disk itself, it looks like I'll need to repartition it because I don't run MagiC or BigDOS. About compatibility: if, for example, I create four partitions on the Zip disk, will the PC read and write to it fine? Or should I stay with the Zip disk's default single partitioning scheme?

Sorry for the questions, as I'm sure HDDriver's manual answers much of this. But while I await its arrival, I'm especially curious as to PC compatibility. By the sounds of it, I'll need to run BigDOS, too. Thinking out loud, though, maybe I wouldn't need BigDOS so long as the Zip disks were partitioned with HDDriver? By that I mean a PC could read and write to it fine, but any PC-partitioned Zip disk brought over to the Atari would require BigDOS. Right?

```
m > $15 MEDIA Media descriptor byte (Not used by the BIOS)

But it IS used by MS-DOS. Failure to set this to an acceptable
value is why early versions of TOS produced incompatible disks.

BTW, there is also a checksum, for which the last two bytes are
reserved for adjustment. If the checksum equals some particular
value (probably 0), then the sector is bootable by MS-DOS. If not,
then you don't have to worry about the Intel boot code.

From: mb@tos.pl.net
Message-ID: <V1BUCYC@tos.pl.net>
Source record: 14397

Well I've got Junior Office version 3.04, hoping to get it working with a Dynalink fax class 1 modem.

I am able to send faxes with no problem, but it's not possible to receive faxes.

I tried with both the auto-receive mode and the manual receive feature, but the problem is the same in each case: the modem picks up the phone but within about half a second it puts the phone down again and the Junior Office receive dialog disappears.

I tried changing the answer string in the configuration|modem dialog, from the default of "&S0=1" to "ATA" and also to blank, but the problem remains.

Is this a known problem? Any ideas about how I could avoid it?

Your assistance would be appreciated.

(And if you're wondering why I bother with a class 1 fax modem, it's for an acquaintance who prefers to get his old modem working rather than buy a new one.)

The last to bytes have to be $55 $AA (or the other way around) to
make it a bootable sector for DOS machines. But even non-bootable
DOS sectors need the jump code at the start if you want them to be
recognized by DOS. So it isn't at schecksum like on the ST (on the ST
the word sum of the words in the bood sector have to be $1234 to make
a bootable sector).

Bye, Hans

I don't realy understand the question. I thought this was how alias
was supposed to work! If the program needs the resouce file you need
to make an alias to that as well. Most of the time you don't put
alias to exectuables but to data files, atleast when I use it.

For the filesystem there is not difference between a link and not.
It treats them both as they were located in the same directory, it's
just that the link points to a file somewhere else, but the application
don't know that.

I wonder???? It's been a long time since I played with this. I used JO
3.04 with a Zoltrix fax modem and discovered that fax-in would not
work if my DTE was greater than 19k2. I read through the specs and
found that this was true and, in fact, fax-out should not have worked
either!

Try 19k2 if you have anything greater set.

Euch, I'm seeing them right behind me.

As a non-english speaking person I did understand quite well what you ment.
If you hadn't pointed this out I hadn't notice it.
Anyway I had my laugh now.

>>All I did was solder 9 wires to the
>>male end and then to the corresponding wires on the female end.

Thanks for the tip. I can't made this my own, being left handed but
I'll find someone to help me. Are you listing Jo?

>>Perhaps the PC one does not have all the pins connected?

Just a thought. Can it be that the cable is just too long? When I
bought that cable I hadn't paid much attention on what was writing on
the box but when I came home it turned out I had bought a 3 meter extension
cable.

I see... hopefully it will be version 7.1 that arrives. There's a good
chance of that since Systems for Tomorrow is out of current stock and had
to backorder from System Solutions in the UK.

4115. Info please - long filenames/GCC/MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-21 00:00:00 UTC
From: gidds@cix.co.uk
Message-ID: <6a5q6g$rv3$1@chlorine.compulink.co.uk>
Source record: 14405

Greetings - help needed please!

I've got some VFAT partitions (i.e. with long filenames) set up under MagiC 5, and I need to write some C programs to use them. Does anyone know how I can do this?

I'm currently using a version of GCC (from Kevin Donovan - thanks Kevin!), which is based on a MiNT version, but the compiled code only recognises the 8.3 names. Kevin suggested I replace my libraries with the MiNT ones, but having installed the MiNT 4.6 libs and includes, I get a whole load of undefined symbols (looks like the startup module isn't there, but it is).

Is MiNT the way to go to get long filenames? If so, how do I use them?

Come to that, can anyone tell me exactly what MiNT *is*, and how far MagiC is compatible with it? Is the MiNT filesystem the same as MagiC's VFAT one?

(BTW, for any English-speaking folks who don't already know, I've discovered that there's a new German-only version of Kobold: v3.5, which is supposed to support long filenames!)

Thanks for any help! (By mail, please.)

4118. 6x ROM layout in ST

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-21 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <JECUCGE@tos.pl.net>
Source record: 14408

I have an ST with TOS 1.0 in 6 256Kbit ROMs. I also have a machine with TOS 1.4 in two 1Mb ROMs, and I would like to transfer the TOS 1.4 from the machine it's in now to the other one.

I guess I need to split the two ROMs up into 6, but to be able to do this I would need to know how the 6 ROMs are organised, compared to the two ROMs. Obviously the two ROMs of TOS 1.4 are for the low and high byte, and the 6 ROMs are similarly three groups of two. But what areas of the larger 1Mb ROMs correspond to each of the three groups of 256Kb ROMs?

Also, the three 256Kb ROMs can of course not hold the entire contents of the 1Mb TOS 1.4 ROMs. Are part of these ROMs blank, or is TOS 1.4 too big to fit into the 3x256Kb?

If so, then I will have to adjust the 6x256Kb ST to take either 8x256Kb or 2x1Mb. But does the hardware of this early ST support 1Mb of ROM? What other things would need changing (I don't have any hardware details of the ST...)

This is one of the oldest STs, with the 1MB of RAM across the front of the board and the six ROMs in two rows of three under the power supply.

Any assistance would be appreciated.

Some of the newer Mac stuf if PPC only and won't run on a 68040.

As I think I mentioned, my 100MHz PowerMac Duo 2300 was definitely
slower than my Performa 630 on the Atari side - particularly slow on
screen redraws. On a fast macine these are reasonably fast, but still
the slowest part of MagicMac. My 250MHz Power Computing clone really
flies, but screen redraws are around 200% of ST speed, whereas the

display average is around 2500%, maybe more.

If you get a chance to try various machines, that would be best.

Here are some Gembench results

Message-ID: <34C5AFD3.6567@GECM.com>
Source record: 14495

I want to use my STE to overlay some titles and text onto some of my home videos but without synchronising the Sync pulses all that results is a mess. I remember being told by a guy at Atari UK that I can synchronise my HSync and VSync of the STE output and the Video output by connecting the H&VSyncs of both together.
How plausible does this sound to you guys? Was he making it up, is my memory failing or can the STE synchronise it's H&V Sync to an external source?
Thanx in advance

Andy Whitelaw

No, the PC won't recognize these partitions. You have to create DOS
compatible partitions in order for a PC to be able to access the medium.

> Sorry for the questions, as I'm sure HDDriver's manual answers much of
> this. But while I await its arrival, I'm especially curious as to PC

With the current version of HDDRIVER (7.1) you don't need Big-DOS or
MagiC if you only want to create _a single_ DOS compatible partition on
your medium. HDDRIVER 7.1 supports a special format that is DOS _and_
TOS compatible the same time.

Message-ID: <6a6uv9$8t6$1742@news0-alterdial.uu.net>
Source record: 14410

Do you want to share ONE Internet connection with the rest in your Family or office?
SYGATE is the software to do that.

With features like Dial-On-Demand, it will connect your LAN to the ISP if
and only if there is access from your LAN to the Internet.

It is easier to use than proxy servers in that it doesn't require the setup in
each and everyone of your applications running on your PCs.

Free download from www.sygate.com

With one phone line, one modem and one ISP account, everyone in your office
or family can access the Internet from their own machine.

It works for Analog, ISDN modem and Cable modems.

Is this the one by Barry Orlando?

>but the docs talk about
>cutting specific traces which may not be the same on the different
>motherboard,

Yes. I did the mod on my STM. I had to 'read' the PCB to find the
correspondence between the instructions and my own board.

and does not discuss what is being accomplished in terms of
>principles.

There are 2 things:

1. A mapping (via a doctored chip carrier) of the 1Mb chip onto the
connections on the PCB which are placed for a 256Kb chip.

2. Fitting an extra address line from the GLUE chip to the RAM chips.

If you then do a mod. to move to 4Mb you have to do a third thing:

3. Fit the 'enable' signal (CAS1 -from the GLUE) to select the second
RAM bank.

Does anyone have or know where I can find a similar
>procedure spelling out the technique with the original 520?

Nope. I looked but ended up applying Barry O's method to the different
board.

If not, a
>SIMM upgrade addressing the original 520 issue may have to do.

If you are not happy with extensive soldering (and, perhaps
consequently) extensive store errors it is REALLY better to go for the
extension board/SIMM method. I aged prematurely when I did the mod!!

Just a thought: those old 520ST machines (without integrated floppies) are probably getting quite rare. I'd say that they will soon have some collector's value, compared to the mass produced STFs and STFMs. I would rather keep it in mint condition and get my hands on an easily upgradable STE for everyday stuff. Besides, you can probably get a 520STE for nearly the price you would pay for a RAM Upgrade board.

Cheers,

Nick.

4133. Bombs. Please help with advice.

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-22 00:00:00 UTC
From: Guentcho Skordev <ut13@rz.uni-karlsruhe.de>
Message-ID: <6a8503$o1i$2@nz12.rz.uni-karlsruhe.de>
Source record: 14418
Cross-posted to: comp.sys.atari.st.tech,maus.sys.atari.okami

Hello,
I have a problem.
In the past the Atari (Mega ST 2) showed sometimes two bombs, but continued wit the programs, so I wasn't very worried. But today it shows very often two or three bombs and doesn't start some programs properly. I don't know if the computer is going broken - I haven't changed anything important yesterday.
Here are some details:
The hard disk is rather full, but that was the case also before.
The TOS version is 1.2, GEM 0.59???, but it was always so, so it doesn't matter (probably).
STZIP shows 3 bombs and ends sometimes when I try to view or extract larger files (100K or more). I think it hadn't happenned with smaller files.
When calling STZIPJR from a GFA BASIC 2.0 program, the file (approx 60K?) was extracted, byt after that there was a box which said there were 2 bombs and I had to reboot.
Okami 0.30 shows a small rectangle at the place of the logo and then hangs up or shows the groups list, but no menu bar, and doesn't work properly. Sometimes I can't click things, although the mouse pointer is visible and moves.

Thanks for every idea.
Guentcho

Followup set to comp.sys.atari.st.tech (feel free to answer in the other group for Okami-specific things).

4134. Mega 4STE to Syquest Drive?

> I have the opportunity to buy a STf for $60. That includes only
>monitor, machine, and mouse. No operating system (assuming it is not in
ROM).

It is in ROM, you don't need any system disks.

> Does it worth it?

$60 ? Not expensive. All depends on what you want to do with it.

> What are the specs of this machine?

Check out the Quick FAQ. A stock STF will have either 512K (520STF) or 1Mb
(1040STF), processor is a Motorola 68000 @ 8MHz, depending on the type of
monitor you will have 320x200/16colours, 640x200/4colours (colour monitor)
or 640x400 on a monochrome monitor.

> What can I do with it?

Just about anything you want, as far as everyday work goes. Graphic
intensive or heavy processing stuff should be avoided though, but for
anything else, it's ok.

You might want to check out the Quick FAQ...

>is a mess.

You require a Genlock. Tricky to find.

Alternative=

Lay a title before the video presentation

1) Get a camcorder and videotape the screen. I did this back in 1985.
2) Use your RF adapter or a Video Key and record onto tape.

Good Programs to use are deluxe paint, or Cyber Paint.
There was an excellent program called Video Text (I think) out of New York
that did a marvelous job. I saw it in 1990 at the Toronto Atari Federation
show and should have bought it then.

Not sure if you know this, but,
The C-Lab Falcons do not have the hardware to support NTSC. They were imported with PAL boards only. You will have to purchase a video scan converter (Computer Eyes Video Scan Converter/Genlock$$) that converts VGA to NTSC. You will also only be able to utilize the VGA output with this type of device. There are plenty of examples in catalogs like PC Connection ect.

Yes, this is possible. You can connect any SCSI drive to the ACSI port
by using a host adapter like the LINK997:

http://members.aol.com/wbsystem/in_e.html

There are also other adapters on the market but this one is the only one
that really supports all kinds of hard disks.

Basically this should work. If possible please send me an email with the contents of the root sector of the IDE drive as this sector is seen by the Atari. In order for this information to be helpful you have to partition the drive on the PC. With this information I should be able to analyze where the problem is.

The partitioning isn't basically incompatible. Especially with SCSI
drives it's no problem to use the same drive with the same partitions on
the PC and the Atari. A lot of users already profit from this.

Christian Ratsch wrote:

> Is it possible to read EZ Drive media formatted by Win95
> on a Falcon with AHDI? Do I neeed a special software?

AHDI only supports a few DOS formats and only if each partition is less
than 32 MByte. With larger partitions you can use HDDRIVER if on the
Atari Big-DOS or MagiC is installed. As long as you only need a single
partition on the drive the software supplied with HDDRIVER provides for
creating media that are DOS and TOS compatible _at the same time_. No
special software is required to access these media.

> Can MagiC PC read Atari-formatted media (or will this fail by the
> Win95-filesystem)?

MagiCPC supports the same media that are supported by Windows 95. This
means you can not use an Atari-partitioned (formatting is absolutely not
relevant, only partitioning is important) with MagiCPC.
Simply use DOS compatible media as indicated above, this works fine.

Sorry to ask this, but do you actually link explicitly the MiNT related
startup module and the MiNT library to your code?

>
> Is MiNT the way to go to get long filenames? If so, how do I use them?

There was a recent discussion on comp.sys.atari.programmer on the use of
long filename, have a look!

>
> Come to that, can anyone tell me exactly what MiNT *is*,

In a nutshell, MiNT is a TOS replacement that supports true
multi-tasking and
file-systems. I think it started as a final year project done by Eric
Smith
and then Atari got interested and took on board Eric Smith and release
MiNT.
The problem is that MiNT + AES 4.1 is rather sluggish so there was an
opportunity
to deliver a faster operating system and that's what the Magic team did.

> and how far MagiC is compatible with it?

I do not know

> Is the MiNT filesystem the same as MagiC's VFAT one?

I doubt it, the MiNT file system is derived from Minix, a UNIX version 7
written
from scratch by Andrew Tanenbaum (published by Prentice-Hall). Linus
Torvald the
creator of Linux started its project from Minix.

Would removable media using HDDriver 7.1's TOS/DOS-compatible single
partitioning scheme get 'trashed' by Win95 during a write?

The reason I ask is that there was a thread a few months ago about Win95
'trashing' floppy disks from the Atari. This is related to VFAT, of
course. The threads, those that I read, were rather inconclusive: some
people said that adhering to 8+3 filenames prevented Win95 from having to
modify the disk to VFAT during a save; others said that it didn't
matter -- disk corruption still occured when it got back to the Atari.

Because I'm running TOS with the 8+3 file system, I'd like to know what to
expect if a Zip disk from the Atari, partitioned with 7.1's special
scheme, is written to by Win95 using only 8+3 filenames?

No DIY projects for that sort of thing I'm afraid. You can get an IDE adapter
from TUS in the UK. It fits inside the machine, and was basically designed for
2.5" drives, but can be adapted to 3.5" if you use another power supply. Oh,
it's STE only too.

I have an Atari Portfolio and an Atari MegaSTE. I have a parallel
interface for my Portfolio. I want to transfer files to and from the
Portfolio linked to my ST via the Parallel interface.
I can't get it to work.
HELP!!!!!!!!!!

OK, this is the story so far:
I had the German package PORTLINK (now sold with cable by the Portfolio
Club UK, under the badge ST LINK), but my cable seems to be broken.
So, number one, can somebody PLEASE tell me how to make a replacement
PORTLINK cable, or tell me where I could beg/borrow/steal a new one?

I have also got the (Austrian) program STFOLIO. This has a diagram of how
to make your own cable for use with the program. BUT the cable requires an
I.C, 74HC125 (you CAN'T substitute the more common 74LH125). I have been
searching for most of the week and NONE of the major U.K I.C suppliers
sell the 74HC125. SO, point number two, are there more recent versions of
STFOLIO that don't require the 74HC125 I.C? The version I have is dated
1990. If I really need this damned chip, then can somebody PLEASE give me
one or tell me where I can order one? Where could I beg/borrow/steal a new
STFOLIO cable?

Point number 3, is there some other program I can use for ST-Portfolio
parallel transfer, and if so, where can i get it, and what about the
cable?

PLEASE HELP!!!!!!!!!!!!!

>//Magnus Kollberg

Actually, I'm not sure why you would need an alias to a data file.
The alias to an executable should allow you to create folders of
program groups, e.g Newsie, Sting dialer, Cab, in one place without
having to clog up your desktop with icons and without you having to
hunt through all the associated files to start the programs.

I checked on the demo of Jinnee, and the Thing desktop. They both
function correctly-- the program gets its path, not the path of the
alias when it is started from the alias. This should be one of the
true advantages of symbolic links and is the way they are used on Mac
and Windows computers.

That's a 20 meg hard drive for an Atari ST. If I remember correctly,
they were housed in shoebox style cases.

Of course, the mechanism inside may have been replaced with a larger
capacity.

As I remember, the controller cards were somehow designed, by atari, not to accept any drives latrger than their respective ones. I had the MEgafile 30 and
I couldn't put anything larger in there. I eventually bought a Syquest 44.

Windows 95/NT doesn't see any difference to standard DOS compatible
partitions. There are already several user profiting from it.

> expect if a Zip disk from the Atari, partitioned with 7.1's special
> scheme, is written to by Win95 using only 8+3 filenames?

This is a problem not related to partitioning and thus not related to
HDDRIVER/HDDRUTIL but only related to TOS. I never had such a problem.

>>As I think I mentioned, my 100MHz PowerMac Duo 2300 was definitely
>>slower than my Performa 630 on the Atari side - particularly slow on

I ran some processor intensive tests under the MagicMac demo on my old
6100/60 (the slowest PowerMac ever made, AFAIK) at work and it clocked in
relatively close to my AB040 Falcon. IIRC, the speed varied between about
60% and 150%. The Mac has had external cache (256 kbyte, I think), a new
graphics card (same as in the 7100) and SpeedDoubler (a better 68k emulator
than Apples's original one) added.

Those numbers make it a lot faster than an ordinary Falcon and remember that
this is on a very old and slow PowerMac.
Unfortunately, the MagicMac demo doesn't like MacOS 8, so I can't test it
on my new G3/266. If it had worked, I wouldn't have been surprised if it
had been faster than any '060 machine. The G3 usually benchmarks more than
five times faster than the old 6100/60.

>>screen redraws. On a fast macine these are reasonably fast, but still

'Screen redraws'? You mean scrolling?
Strange that that should be slow.

>Thanks for the info.
>Seems like a "no go" situation -I'll loose whatever I do.

I doubt you would feel that a PowerMac would be too slow under MagicMac.

>Why aren't ASH taking advantage of the PPC chips? After all, Apple don't

The only way they could take reasonable advantage of it would be to make
NVDI native. Speeding up the rest of the OS shouldn't be noticeable, since
it usually doesn't really do anything anyway.
The problem is probably that NVDI is largely 68k assembly code (it would
have to be to get decent speed on normal Ataris) and converting that to C
or PPC assembly would take quite some time.

Perhaps someone wants to try writing some native PPC device drivers for
the FenixVDI? ;-)

>I wish Apple could make provisions for a 680x0 expansion board in their new
>PPC computers!

There wouldn't be any point if you had less than a fast '060.

>But according to someone I asked in a local Mac newsgroup the 68K
>applications should run pretty well on a PPC computer, and I was told that
>unless ASH had been "messing things up" it would work fine on a PPC Mac.

That's quite true. While emulating a processor is not exactly fast, those
PPC's definitely are.

>Andy Whitelaw
I believe this is thw case - I've been working on such a project - what I
think you have to do is switch off the internal timers, and feed them
with teh appropriate signal from an external source.

i think it's all down to pin '3' of teh monitor port - 'clock select' - but
what you set it to is still a mystery.

I've been extracting the timing signals from a video source using an LM1881
chip - but am still unsure exactly what voltages to apply to the appropiate
pins - teh *other* thing is to get it all mixed withou having a feedback
loop (that way teh ST and video source being fed back into the inputs &
causing all sorts of problems) - I suspect the solution would be to use a
couple of unity-gain buffer amplifiers to stop this.

If you get this sussed - please let me know

It might be, although mine is nearly 2 meters long. Also, I never
bothered putting the casing round the male plugs that go under the
keyboard so I guess if shielding was going to be a problem then I
would have suffered from it!

If you have access to a continuity tester then you could check the
cable yourself (unplugged from the machine and mouse). If not, a
battery, a lightbulb, and a length of wire will do the same job. All
the pins at one end should connect to the corresponding ones at the
other end, and not to any of the others.

I'm not explaining this very well!

By all means get the new SL98, it IS great. But DON'T EVER LET GO OF YOUR OLD 1.09N!!!!!! It is still the best tool for quick layout jobs, and uses fewr bytes to run. I need both in my setup.

I'm not so sure. I tried replacing the 256Kb SIMMS in an Amiga 1Mb upgrade
and it acted as though they were still 256Kb SIMMS. If they act the same
way, they should act as though they were 1Mb, rather than 4Mb.

> suggestions please?

Have you put vfatconf.prg/rsc in \magic\start\ ? If you have, once you
set up which partitions/floppies you want the LFNs enabled on, save the
options (ALT-S) and that sets them permenantly. I think the temporary
button is there so you can turn them on or off for that session.

Another way of setting them permenantly is to add the required drives in
the MAGX.INF as below:

#[vfat]
drives=ABDEF
; these are the drives I want LFNs on.
#[aes]

That's how I've set mine up. A:, B:, D:, E: and F: have LFNs enabled,
C: doesn't.

I tried in the csas group, now I'll try here. Please email any responses as I don't come here often.

I have a 1040stf with a rev c mainboard. The ram is under the power supply and the roms in front of that. Right now there are 6 sockets and 2 chips giving tos 1.0. I have a 6 chip set of tos 1.4. There are 2 pairs of pairs of pads by the socket closest to the front of the machine. One pair of each pair is labeled 256K and the other pair 1M. The 1M pair is "jumpered" (solder blob) now. If I change these pads will the 6 chip set work, or is there more to it? I remember doing a similar thing only instead of pairs of pads, there was a 0 ohm resistor that went from holes 2-3 to holes 1-2 of a trio of holes in the board (there were 2 of them) Thanks for any help and I apologize if my explaination and questions are unclear.

I use the hit and miss to back up my software. Then record it.
I haven't used it in years. So I don't even know if it handles programs
like Space Ace and the like that had half the program on each side of the
disk so that single sided disk drive users could play the game.
Now since my happy cartridge is less than 2 inches from my fingertips, I should
actually try to back up my space ace game.

>
>In case you didn't know this cart is used to make backup
>copies of disks that are otherwise uncopyable.
>
>email to mbur@gallifrey.taranaki.ac.nz

I am surprised to see they made it that far away from the US. I don't
think they were made for very long? I never tried it with a Mac emulator
and mine doesn't have the extra drives either.
I got mine used back in 1989 and I have used it all of three times.
I backed up RVF racer, Master Tracks Pro for a High School collegiate that
only had the original and feared its loss in case of a catastrophe, and
I think I used it for Dungeon Master. Which was overkill.
Really the .S file is just a database, create your own. I am sure there are
newer .S files that were distributed from happy, but you probably won't
find them because Most ST users have moved on and happy cartridges sit in
the closet unused. Remember it was also an effective pirate tool and pirates
don't have much to take from the Atari community anymore, so they too have
moved on.

Maybe I'm just thick, but don't euro Falcons (including C-Lab) have a PAL composite output in place of our NTSC RF output? In that case, there should be no problem converting the PAL composite out into another standard, i.e. NTSC.

Thanks for the info. Systems for Tomorrow let me know on Saturday that's
the version I'll be getting. Right now I'm running the HDDriver 7.10 demo,
having just installed the Zip drive today (even though I can't fully
access it with the demo). Funny, the demo says writing data is much slower
than in the unlimited version, but writes to my hard-drive seem just as
fast as my old ICD driver <g>. Very nice software, indeed.

4192. EZ-230 / Hades 040 problem

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-26 00:00:00 UTC
From: curis@news.ens.fr
Message-ID: <6ahqhcsc1@nef.ens.fr>
Source record: 14327

Hello,

I own a Hades 040 and a SCSI Syquest EZ-230, and I've got big problems
with it.
When I write intensivly on the EZ-230, I get, after a while, an error
: << Spurious interrupt >> (Idon't know how many bombs it makes). After that,
the only think I can do is switch off the computer and switch on again - no
reset possible !
Once it occured for a disk, it then occurs frequently. It seems to
occurs when the cqrtridge begins to be a little empty (around 60 Mo), but I'm
not sure about that last point.
If I start a << sector test >> with HDRUTIL, it also produce the
error, often between sectors 10000 & 40000. After that, cartridge is no more
recognized. I tried to format, it doesn't work (after a while, << impossible
to format this disk >>).
Once the error occured, the Syquest doesn't want to eject the
cartridge anymore :-(

Error occurs with TOS or DOS cartridges, with or without BigDOS, and
it still occurs if there is no auto program and no accessories.
I use HD Driver v. 6.21.

Does anybody have an idea of the origin of the error ?

Thank's

Well impatience and bull headedness wins out. After removing the rf shielding, I found a 3rd "jumper" next to the mmu (I assume.) I changed all 3 jumpers, put it back together, and it was fine.

Is there an appropriate place where (if I get to it) I can upload a text file documenting the change? Would anyone be interested?

Thanks to all.

> and the 6 ROMs are similarly three groups of two. But what areas of the
> larger 1Mb ROMs correspond to each of the three groups of 256Kb ROMs?

You can simply split up the ROMS in three low-byte and three high byte
parts.
Only the first 96 kB matter. The last 32 kB in the ROM is empty.
(kB is kilobyte)

Note: the size of the ROMS is expressed in kilo bits. So a 1Mb ROM
contains
128 kilo Byte data.

> Also, the three 256Kb ROMs can of course not hold the entire contents of
> the 1Mb TOS 1.4 ROMs. Are part of these ROMs blank, or is TOS 1.4 too big
> to fit into the 3x256Kb?

TOS 1.04 is just like TOS 1.0 and 1.02 192kB. (Start adress of TOS 1.04
is $fc0000, so there is 4*64kB left to the end of the 68k's adress
space.
the last 64kB is reserved as hardware i-o, so there is only place for
192 kB ROM.) So the first three quaters id enough

> If so, then I will have to adjust the 6x256Kb ST to take either 8x256Kb
> or 2x1Mb. But does the hardware of this early ST support 1Mb of ROM? What
> other things would need changing (I don't have any hardware details of the
> ST...)

No modifications needed.

> This is one of the oldest STs, with the 1MB of RAM across the front of the
> board and the six ROMs in two rows of three under the power supply.

I have got a board just like that and there are no problems with TOS
1.04 in
6 ROMS.

Succes, Hans

There is a third pad near to the pr0cessor if I am not mistaken. (It's a
long time ago I modified ST's to upgrade TOS.) But basicly it's simply
closing and openong the right pads to go from 2 to 6 chips.

Your just thick:). Just kidding:). No, at least my C-Lab Mark X did not
have any RF modulator or plug. I think those guys use SCART connectors.
Please correct me if I'm wrong, but that connects to the monitor port and
picks off the RGB signal. On my (or I should say John Perez's Mark X)
there was no modulator, or circuits to support that type of output.
Maybe the Mark II's are different. That is not to say that it dosen't
exist on Atari PAL models, just not the C-Lab I had. I have a
composite cable for the monitor port, and the first thing I checked
was video output with Apex. I was disapointed. Steve Cohen warned me
about that and the "special" SCSI connector.
If the original poster (now I lost his name) has an RF plug, then he
surely should be able to get a composite cable for his Falcon and
convert it like you say. He didn't really say. I think the C-Lab left
this part out to save some money.
Anyone else with a C-Lab machine to confirm this?

Mike

I have a question for you all.

Does anyone know of the person in charge of comp.sys.atari.st.announce?

Is it still active? I've subscribed to it for several weeks now, and there
is nothing in it.

4199. Drivers for Atari in-house Ethernet Interface

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-26 00:00:00 UTC
From: Curt Vendel <webmaster@atari.nu>
Message-ID: <34CCBA34.925592D5@atari.nu>
Source record: 14334
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Atari Germany had a company called Reibel (Not sure if that is the
correct spelling) develop VME and MegaBus ethernet adapters for the
Atari Mega's, Mega STe and Atari TT030 computers, I know Atari Unix
System V.4 has the drivers built in to use this, but I've heard there
were drivers for TOS TCP/IP as well as IPX drivers for TOS, does anyone
know where the drivers are for these cards, I have 15 of them and if I
can find the proper drivers I would be willing to sell them to anyone
interested.

4200. Iomega Zip drives on TT030

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-26 00:00:00 UTC
From: Curt Vendel <webmaster@atari.nu>
Message-ID: <34CCC299.3BF2B626@atari.nu>
Source record: 14335

I tried briefly hook up a Zip drive to my TT030 and noticed that it will scan drive 0, then drive 1 then stop, hmmmm rather odd, so I switched over to a JAZ drive and set the ID to 1 and the TT030 found it, but when I tried to add device D: to the desktop and read the Jaz it didn't work (probably something I hadn't done right yet, the drive was still formatted as 1 GB from an IBM, so I'm sure I have to add something or another to get it to work).

Needless to say, how do you get a TT030 to recognize the ZIP drive when all it can be set to is ID 5 or 6 ????

Hello Atarians,

Alex Yu, of ATY Computers in Oakland California, is back and in business again after being robbed at gunpoint and losing nearly everything in his shop, including PC, ATari computers, parts, chips, diagnostic tools, etc. Thanks to the kindness of some fellow Atarians in the form of donations of parts, $, etc., he was able to open up a shop at a new (and hopefully safer) location. Alex did my Nemesis installation, Steinberg audio mods, and has been a friendly source of info for me. If he has done any work for you, or has been helpful in other ways it may not be too late to help him out. He asked me to post his new address and phone info. His email remains the same.

>The robbery was a terrible thing. Yet I feel a lot better now knowing
>I have so many caring customers, no I mean friends, out there helping
>me get back on my feet. All your warm encouragement and help will be

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

ARGH! I was replacing the internal 40M HD with a newly purchased 2G HD.

After having some problems, I returned the original 40M HD.

Now whenever my system boots as soon as it reads any disketter (Floppy or Internal SCSI or external ADSI(sp?)) the system either lock or I get multiple bombs (sometimes I just get the top of the bombs).

So I can boot up my system to get to the desktop if I have no diskette in the drive (A) and by pass all the HD (disconnect them all).

But if I double click on the floppy drive I lock up.

I have a 2M ST RAM, 16M TT RAM, TT030 with CaTTamaran.

I've tried to boot from the Internal HD, Floppy the External. (The external is fine as I book with it for my STE which 'm using now.) But I'd really like to get my TT going again.

Originally, when I booted I use to see ADHI 6.061 start before the bombs and the system would lock up. But now I don't even see this.

Anyone have any ideas? Please, if possible reply to me directly at schrist@interlogl.com

If I remember correctly this was a moderated group and after a long
period with almost nothing being submitted to it the moderator
(someone at lexicor software? or was it Annius Groenink the Edith
guy?) asked in here if anyone wanted it and the original .binaries (or
was it .software?) group. In the absence of any interest whoever it
was decided to close the groups down, so they shouldn't actually be
active. To post in them the message had to be approved by the
moderator and there isn't one, so they just disappear into oblivion.

This must have happened since January 1995 as that's when I first got
on the net and I remember the closure notices some time afterwards.
There was an attempt within the last 18 months or so to set up a new
unmoderated binaries group in the alt hierarchy but I think this died
the death as most providers didn't carry it.

Cheers,
John

Sure, download the prgs from the various FTP sites and copy onto
720K PC Formated disks, the Atari should be able to read these.
Note: Must be 720K disks, not 1.44!!

From what I read, you can disable the internally generated H & V sync interrupts. There is a register that has a bit which selects internal/external sync & setting this to external causes the ST to lose sync if there are no external sync signals present.

>>
>> i think it's all down to pin '3' of teh monitor port - 'clock select' - but
>> what you set it to is still a mystery.
>>

Again, from what I saw, if you disable the internal syncs (which are also output on the relevant sync pins of the Glue chip), the H & V sync interrupts are removed.

I assume the intention was to allow external syncs to be (AND THIS PART IS A GUESS) fed into the H & V sync pins to generate the H & V sync interrupts.

The voltage would be TTL levels.

>> I've been extracting the timing signals from a video source using an LM1881

>> couple of unity-gain buffer amplifiers to stop this.

I believe that for successful video mixing, you need to have a master sync generator, & everything syncs to this master source. You need to strip the syncs off the signals.

If you want to overlay ST graphics with an external source, perhaps you can find the correct way to disable the ST's sysnce & feed in external syncs, thus locking the ST to the source. A simple video mixer would be able combine the outputs of the ST & external source, eliminating any feedback problems.

Correct, However comp.sys.atari.st.announce is classed as moderated,
hence the problems, everything has to go to the moderator to check
before it goes into usenet, this is where the problem is
>
>>Is it still active? I've subscribed to it for several weeks now, and there

4211. Help with TOSBOX or PacifiST; reading .HYP files and where to put .ACC files

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-27 00:00:00 UTC
From: tomio@TODaiTODmewTODco.jp
Message-ID: <34cd9247.81373953@news.mew.co.jp>
Source record: 14346

I've got both TOSBOX and PacifiST running on my Wintel box, and
I need some help that's so basic it's on none of the web pages nor in
any of the FAQs I've looked at. Just two questions:

1) What application do I need to read .HYP files?

2) If I'm using an emulator, where do I put .ACC files so they'll
appear on the desktop?

That's it for the questions; if you are interested in why I'm asking
please read on...

I want to get on the internet using an Atari Emulator, and, using a
screen capture utility, capture screen snapshots of every pertinent
step from unzipping/installing utilities to configuring STiK/STiNG, to
configuring and using CAB/Newsie/Antmail. The goal then is to use
these figures and the learning experience of getting my Atari emulator
online, to create a well-illustrated users' guide which documents the
entire procedure.

This guide will then be sent via post to my father-in-law (in the UK),
to help him get his Atari 1040STFM (now with 2.5MB installed) on the
internet. When I visited earlier this month, we had STiK working and
dialing the ISP, but CAB never could quite get on the web. Now I'm
back in Japan and so I have to try to do this remotely, using an
emulator on my Wintel box.

(In case you're wondering how we got him almost online with no
internet access, I downloaded all software I thought we'd need, then
transferred to two floppies forced to 720KB and hand carried them to
the UK during my brief visit; he bought a modem the next day, was
really excited about the prospect of getting online, and was a bit
disappointed when I had to leave, having failed my mission)

Summary:
In order to be able to make screen snapshots on an Atari emulator, I
need to know how to install .ACC files (on either TOSBOX or PacifiST);
also, some Atari documentation is in .HYP format and I need to know
what application I should download in order to read these files. Any
brief clues/links/URLs/FTP sites/FAQ sites/ideas/suggestions
appreciated.

Thanks,

Steve Madsen

You don't need to use an emulator to transfer programs, just format
a 720K disk on the PC, and tranfer the files over to it that way.

Don't try to use a disk formatted on the ST, as this doesn't always work.

Cheers,

Nick.

The best solution is a driver like HDDRIVER that allows individual drive
IDs to be checked even if they are not in consecutive order.

A buffer amp would certainly stop the feedback problem. Regarding the
voltages, I would assume that the best place to start would be to input
the same voltage levels as the port outputs. Does Atari UK still exist?
If so a quick email to them may solve the clock select problem. Does the
monitor port have a 'clock in' signal? I can't recall offhand and I
don't have any info with me at the moment.

Cheers

4219. New ST web browser!

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-27 00:00:00 UTC
From: John Whatty <meva.tele@virgin.net>
Message-ID: <34CDE1E9.E39@virgin.net>
Source record: 14354

Visit http://operasoftware.com/alt_os.html

or email magic@operasoftware.com

and tell them we want a browser for the Atari ST.

At the moment they produce browsers for PC, Mac and are adding Amiga!
If we send them enough emails they may support the Atari ST, but only if
they get the interest, so get emailing now .....

John.

At least with OS8 (but I would guess also with other OS versions) Speed
Doubler and MagicMac don't work together.

> >I doubt you would feel that a PowerMac would be too slow under MagicMac.
>
> That's good to hear.

Did my other post, giving Gembench benchmarks, get to the newsgroup - I
can't recall. A few display items are quite slow. For instance, on my
fast machine running in 256 colours and comparing with an ST in mono,
vertical scrolling was only around 200%, vompared with a 2000% average,
and it
And on my 100MHz Duo, vertical scrolling was actually slower than the
ST. So it felt slow, even when the CPU was working at a satisfactory
rate. Unfortunately, the scrolling was important for one or two programs
that I used.

> I might end up using "Connect" if when I decide to use a terminal emulator

> just want to grab/send offline packets etc and then go offline again).
> And MacSOUP is great for that -because you can choose if you want to do a
> PPP connection or import SOUP packets.

Before I moved to OS8, Connect worked fine. But it seems to crash (for
me and at least one other user) under OS8. But it may be that it is a
problem with my clone - when I installed MM it made a comment about not
being able to hide an address - maybe Connect is the one program I have
that tries to access this. I think the problem is more likely with the
clone than with the OS.

You can use a one-button mouse, of course (Command-click for right
button), but I use a Logitech trackball, which has three buttons, and
there are other multi-button mice which work. But the docs imply that
they don't all work.

Hello,

Dans l'article <34CDA3AE.14D8@ooc.de>, Uwe Seimet , <us@ooc.de> a ecrit :
>>Emmanuel Curis wrote:
>>This indicates a faulty computer hardware.

More seriously than my other message : can't it be the Syquest fault ?
I ask that, because it sometimes act strangely : when inserting a cartridge,
it doesn't want to start spinning. The orange led blinks slowly, one can hear
"clac clac" but nothing else happens. And it's impossible to eject the
cartridge with the eject button. I must use the emergency hole...
It dit that just when I bought it, then it worked correclty and now it
starts again to do that.
I don't think it's Hades fault, because even with the EZ230 not
connected to the Hades, it does that (and it should not, as I tested before).

Don't say me both Hades and Syquest have problems :-(

ST-Guide. Sorry, no URL handy, but its on all the usual FTP sites...
The latest English version can be found at:
http://www.compulink.co.uk/~inactive/

> 2) If I'm using an emulator, where do I put .ACC files so they'll
> appear on the desktop?

Put them in the root directory of your boot drive. IIRC, with PaCifiST
this is a:\ (I believe that it doesn't set c:\ as boot drive, although
I could be wrong). Note that this is the virtual drive, so if you edit
your pacifist.ini file it can be anywhere.

t>
t> I asked this once before but never got a reply. Has anyone gotten
t> MagXdesk to work properly with an alias? With the version that comes
t> with MagiC 5.1, you can create an alias ok, but if you try to run a
t> program from an alias, the default path is set to the path of the
t> alias, not the program. That means no program with a resource file

I don't use aliases but I've just tried it with Everest (a prog that seems notorously fussy about its RSC and INF files!). I ALT-dragged a copy from my D:\EVEREST directory to the root of M: It worked fine.

One thing does occur, the example I've used has an environment string set up in magx.inf (#_ENV EVEREST=D:\EVEREST\) so it might pay you to try one or two experiments in that direction. You'll have to reboot to make the changes known BTW.

Speak to 'ya later!

FIRST THE SOFTWARE:

1. TRUEPAINT V 1.02 $18 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon).
Needs Multitos.

4. LDW power: Excellent spreadsheet program. It makes all the files you create with
this software compatible with the Lotus 123 format (has acc/prg. covert utility)
$ 2.00 no manual original disk only. (all Ataris).

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female) so you
can plug in to your external ampolifier. No need for pre-amp. It will go with
hayes modem/cable and the famous beetle mouse!. $50

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $32.
(has original PC software)

3.Atari PS for external Disk Drive $10

4.external PS for the 520ST $8.00

Free stuff (with the buying of any of the items :) :

Free manuals: HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments
Atari falcon AFM; D2D; SAM.
Imagecopy 2
Pagestream 2 quick start manual
available
omnires

truepaint
Soft-hard:
- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.

If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US priority mail. (if you are in the US; I am willing
to send abroad also) Regards,
Phil.

SpeedDoubler, among other things, is a 68K emulator that's faster than Apple's 68K emulator. Like the 68K emulator built in to PPC versions of the MacOS, SpeedDoubler allows 68K software to run on PowerPC machines.

The RAM part you mention is probably RAM Doubler, also from Connectix. RAM Doubler replaces Apple's virtual memory manager with a more efficient (and generally faster) version of virtual memory.

The same as for modem connections ... SERIAL doing the low level stuff,
TCP and UDP as transport protocols, RESOLVE for domain name translation.

If you're talking about accessing the Internet through the NT machine, you
need to do proper routing on NT's side, and you need a proper IP address
for the ST.

Your thinking of RamDoubler, Hallvard. That dosen't work with MagiC
Mac. (Come to think of it, it dosen't work with the Mac O/S either:).

Mike

4237. Networking via a Falcon's LAN port

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-29 00:00:00 UTC
From: Keith Jackson <enxkj@unix.ccc.nottingham.ac.uk>
Message-ID: <34D0D0B8.1C5E@unix.ccc.nottingham.ac.uk>
Source record: 14372

Every once in a while it would behandy to network my PC to my BBS
machine, a 4Mb, TOS 4.04 Falcon. I would like to be able to leave the
BBS running while I access the Falcon so using the modem port is out.
This leaves me with more than a few questions!

Is it possible to connect the LAN port to an RS232 port on a PC?
The PC is running W95 OSR2 and the Falcon is running TOS. Can I network
then without changing to a multitasking OS on the Atari?
Is STinG compatible with the networking software in W95?

On a similar vein, would it be possibe to network an STe (which I could
run with MagiC v2) and the Falcon via the MIDI ports *and* allow the BBS
to function normally on the 030, if a little slower? I'd like to do my
personal mailing on a separate machine so that I can keep the Falcon on
line longer for my users. At the moment, when I'm writing they can't get
on the system.

Thanks for any help,
Keith

Nicholas, Thanks for the help (a I replied in my previous mail.) I went
back and looked daily (at least) and didn't find the answer I was
looking for. I scoured the faqs and found a way to add 2.06 and to add
1.4 to a machine without the jumpers I described, but not what I was
looking for.

Again, thank you for your help.

Ed

4242. Re: Zip Plus SCSI woes

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-29 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95q.980129231610.3529A-100000@exeter>
Source record: 14377

Hi all,

Okay, here's the latest on my Zip woes - to recap, I'm trying to get a Zip Plus drive to work on the SCSI chain after my Link 2/MiniS hard drive.

After some help from Karl Brant from System Solutions, I've managed to locate and remove the termination from the MiniS drive. So now, I've got:

Atari ---> Link 2 ---> MiniS (no termination) ---> Zip Plus

The Zip Plus is supposed to automatically set its own termination, so, problems over, you'd think. Hmmm...

With the Zip Plus connected, the SCSI communication "works" but is extremely unreliable. Both HD Driver 7.1 and the ICD 6.5.5 driver software read garbled data - sometimes the Link is not detected, othertimes it detects the Link but displays the drive data with errors - for example, in normal use the driver software reports that the MiniS is a "Maxtor 7213-SCSI" drive, which is correct. With the Zip plugged in, this usually is reported as something like:

"Maxxrr 7343/SSSI"
or "MXXor 7724--SSIO" or other garbled text
(it's different every time)

indicating something is seriously wrong with the SCSI communication. Unplugging the Zip and leaving the Zip SCSI lead dangling improves the SCSI communication - there is still the odd error in about 1 in 4 tries (in other words, I get "Maxtor 7213-SCSI" mostly, sometimes "Maxtor 7213-SSSI").

Using IDCHECK.PRG which scans each SCSI id and reports the names of any connected drive, I do occasionally (about 1 in 30 tries) find a "IOMEGA ZIP 100" drive, but normally no drive is detected on id 5 or 6, which is what the Zip can be set to. The Zip Plus is supposed to autodetect whether it needs termination or not and automatically do it, but I'm wondering if this is perhaps a result of the Zip not terminating itself? I've tried various combinations of power-up sequences between the peripherals and computer and nothing seems to make a difference.

Have you guys got any suggestions?

I suspect that this is due to the HD driver that you are using - ?AHDI? Some drivers will not accept a series of IDs if they have a gap in the numbering. ICD, CBHD, HD-Driver etc are fine, so try one of those.

Regards
/Peter/

A recent post describing difficulties with Notator and SysEx. I have often used SysEx with Notator, and while there are different ways to handle such messages in this program, I have had no problems.

If you state in more detail what the problems are, maybe I, or someone else can help. Otherwise contact me direct.

[snip details of errors]

Did you try putting the Minis (when it was terminated) at the end of the
chain initially or do you not have the cables for it?
As the chain is, maybe you should check the dip switches on the Minis
and check that it is supplying TERMPOWER too.

Here's what I've found:
------
From: John Kolak <jkolak@jps.net>
Subject: Re: 6chip/2chip question
Date: Wed, 28 Jan 1998 14:03:13 -0800

John Kolak wrote:
>
> There was an instruction sheet atari issued with TOS 1.4 that told which
> pads to jumper for 2 to 6 chip conversion. I'll see if I still have it.

According to the Atari tech bulletin, the jumpers at A16, A17, and CE
are marked 256K (for 6 chip) and 1MB (for 2 chip), and the appropriate
pads are closed for the proper configuration. This is on the 520/1040 ST
```

configuration.

The Mega ST series have PC type jumpers at W2 and W3 which are jumped 1-2
for 256K, and 2-3 for 1MB. Also, for 256K close W4 and remove the 74LS11 if
present in U12. For 1MB open W4 and add the 74LS11 at U12 if missing.

Hope this helps...

Cheers,

Nick.

4247. Problem receiving fax in Junior Office with class 1 modem

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-30 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <SYLUCCL@tos.pl.net>
Source record: 14381
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

You might remember my previous posts about Junior Office and faxes.
Although I said I had it working now, I have since realised that there's
still a problem.

The problem is that although faxes can be sent fine, they are not always
received properly. Sometimes the faxes come in without a problem, but
other times the page data is all sent but at the end, the sending station
reports "no response to EOP repeated 3 times" and the fax is not properly
received.

What does this mean, and what might be causing it?

This happens with almost all the fax machines/modems I've tried receiving
from, except one. That is the telephone company's fax testing service
where it will fax back any document sent to it. Faxes received from this
service always work fine. But I can't receive faxes from anywhere else.

I can't figure out what can be different about how Telecom sends the fax
compared to the other faxes that don't work.

Any ideas?

I don't have a ZIP drive but the EZ-Flyer I do have is also supposed to set its own termination and, in my case, it does. However, the docs say that it doesn't always work and that you may have to terminate it separately. Another thought is whether you're plugging the ZIP into the chain with he right socket. I assume that, like the Flyer, the ZIP has two ports on the back? On the Flyer I have to use the A socket, from which I take it that if the adaptor detects anything in the B socket it by-passes its own termination.

Hope this helps,
Keith

THE ATARI ST QUICK FAQ - v2.3 / 1998-01-29

The 'Quick' FAQ was initially intended to be a small list of resources made to avoid comp.sys.atari.st newcomers asking the same questions over and over again. However, as the project progressed, and other members of the Atari community became involved, it simply became bigger and bigger. I doubt it really deserves to be called 'quick' any more, but hopefully it will still serve it's original purpose.

4254. "The StatiSTitian" reported strange values

Newsgroup: comp.sys.atari.st.tech
Date: 1998-01-30 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <34d1491632c8904@rz.uni-karlsruhe.de>
Source record: 14388
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hello,

Hase anyone experience with STATS.PRG?

My former problems (2 and 3 bombs) were caused most probably not from a
hardware problem, but from a corrupt ".RSC" file (I don't know why it had
changed, but that's another problem). However, I looked what some
programs say and I noticed something strange: The StatiSTitian, V 1.0
shoows that information:

Total RAM: 2037760 bytes
Free RAM: 1451586 bytes (071.2%) of total RAM
Used TPA: 561086 bytes (027.5%)
System Area: 51712 bytes (002.5%)
Screen Area: -26624 bytes (0-1.3%)
^ (!)

There are also two pie charts:

The first is named "TPA Allocation" there I see:
pattern for "Free RAM" approx. 73%
pattern for "Used TPA" approx. 27%

The second one is named "Total Memory Allocation"
There I see only:

pattern for "Screen Area" approx. 2%
pattern for "System Area" approx. 98% (!)

Can anybody tell me what could be the source of
these strange numbers

Thanks
Guentcho

> Is it possible to connect the LAN port to an RS232 port on a PC?
> The PC is running W95 OSR2 and the Falcon is running TOS. Can I network
> then without changing to a multitasking OS on the Atari?

It depends what you wanna do, and how you wanna do it. Without a multi-
tasking TOS it's gonna be difficult. Maybe the FTP-Server for STinG can
run as an accessory, but this requires that your BBS is a GEM program or
accessory too. If the BBS is a TOS program (which most of them are), then
you have no choice, you definitely need preemptive multitasking for
accessing the Falcon while keeping the BBS running.

For this, AFAIK you can install MiNT and run the BBS in a TOSWIN window.
Then you can startup the FTP-Server too to make the Falcon accessible
from the PC. MiNT and TOSWIN are freeware.

> Is STinG compatible with the networking software in W95?

Hmm, strange worded question. STinG is TCP/IP which is an Internet-wide
standard. Microsoft's Netbeui however is highly proprietory (what do you
expect anyway :-( ).

I understand Windows 95 has a TCP/IP stack built in too, but AFAIK no
servers come with it. But it comes with a sort of ok FTP client and a
horrible Telnet client. As you'll want to access the Falcon via FTP,
it should work.

> On a similar vein, would it be possibe to network an STe (which I could
> run with MagiC v2) and the Falcon via the MIDI ports *and* allow the BBS
> to function normally on the 030, if a little slower?

Sure. However, on the Falcon's side you'll need to do the same as I outlined
above, i.e. run both the BBS and the FTP-Server at the same time, which (if
you refuse true multitasking) is possible only if at least one of them can
run as an accesory, and the BBS is not a TOS program.

The BBS should not be slowed down significantly.

Cheers Peter

Sounds like similar problems I have with SyQuest EZ135: not being a techie, I can only suggest it is because of heat. Continuous use for some time causes heating of physical components, therefore expansion. I find that switching off for several hours does help.
I hope that's is all that's wrong, otherwise I can't help. Sorry.

: Could you tell us once again which version of JuniorOffice you use and on what
: kind of hardware (Falcon, ST, TT, Clone, Emulator) and OS (Geneva, TOS, MagiC,
: N.AES).

It's being used on an Atari STE with 4MB RAM, TOS 1.06 or 1.62 (I don't know which) and a 14.4K fax/data modem. I believe it was also tried on a C-LAB Falcon MK-X with 14MB RAM, on the modem2 port, under TOS 4.04.

It's Junior Office 3.04 English version. However, since the supplied fax driver would not receive faces properly, someone sent me a different driver that does work (I believe it came from the German version 2.x or something). I thought all was ok, but now this problem has turned up...

(It's not me who is using the software, so I can't give you any more details...)

I find that switching off for several hours does help.
I hope that's is all that's wrong, otherwise I can't help. Sorry.

Well, I sent back the EZ to the sailor (warranty...), we'll see with
the new one.
But I'm afraid the Spurious interrupt is something else... Someone
told me that first Hades had a problem with SCSI. I'll try to get that fixed.
In fact I remeber now I've had sometimes some similar problems when
loading many fonts from CD with Calamus... But much more rarely.

Ok, in that case, what I'll do is buy a SCSI terminator and stick that
in the Zip's second port. I was holding off 'cos they're about 20
quid apiece - let's just hope it works..!

Keith also wrote:

> Another thought is whether you're plugging the ZIP into the chain with

Yes, the Zip+ has two sockets, one labelled "Autodetect" and another.
You _have_ to use the autodetect port because otherwise the Zip+
doesn't know whether it's connected to a parallel or SCSI link.
Furthermore, you also have to use the autodetect cable that comes with
the Zip+ as it uses redundant pins in the cable to make the
distinction between SCSI and parallel communication.

If the program works the same that I think it does, it resets everything.
except a couple of pointers in the page 0 stack. Shutting the system down
resets everything, if you give the RAM time to discharge (takes about 15sec
to 3-4min depending on;;how much ram and how much filtering there is on the
motherboard). I have found that those few pointers can mess something up.
Using the reset switch only results in a warm boot where ram memory is
retained. PACMan aka Bill Pike

> If it is, what hardware, software etc., do I need?
It sure is, I am running two RLL hard drives on my computer now. There are a couple of requirements however: #1. The drives must be embedded SCSI or you must have a SCSI controller for them. #2. You will need a host adapter to convert the ASCSI from the DMA port to SCSI. #3. Depending on the drive size you will need to partition it as a normal partition may only have 16megs (for TOS<1.4) or 32megs (for TOS=>1.4). Many on the HDSoftware now permits BGM partitions where you can have larger cluster sizes for more storage on the drive. These will let you partition up to 2gig, I think.

BTW I have been using a ICD Host adapter for 8 years now without a problem. There are others available.

I'm not sure but I think there are different criteria. comp.sys.* is
some sort of priviliged hierarchy iirc. The group might still be
active.

>To post in them the message had to be approved by the
>moderator and there isn't one, so they just disappear into oblivion.

I forget the name of the moderator but this is what happened:

Some of us tried to post to the group but nothing appeared.
[time passed]
Moderator posts saying the group is going to be closed - does anybody
object
[no time passed]
Lot's objected.
Lot's emailed.
[time passed with no response from moderator]
Group shut down.

The intention was to shut the group down well in advance of saying so. This is patently obvious simply because nothing appeared there for substantial periods before his announcement. Why the moderator failed to do any moderating is anybody's guess. We shall never know.

Having failed to do his job he ignored all protests when he did post, and by doing so, took away all chances of anyone else becoming the moderator - and there were offers. Suggestions that the group be made unmoderated also fell on deaf ears (obviously).

>This must have happened since January 1995 as that's when I first got

It would require a usenet guru to ascertain the true status of the group. If it were found to be active then the simplest course of action would be to remove the moderation.

>I turned the computer off and back on, it worked fine.)

If it's the same as the coldboot.prg I used to have then all it did
was make the machine think it had just powered up by changing some
values in memory. I forget which offhand but they are documented. It
would then jump through the system reset vector whereupon the system
bootup code would perform a cold start (on finding invalid memory
config iirc). This is obviously very different to turning off the
power!

> verify if it works with OS 7.5 or at all with SpeedDoubler?
> And does the full version of MagicMac work with OS-8 at all?

Yes MagicMac works fine with OS8. There are some programs that just
don't seem to work with MM, but these may be ones that don't work even
with Magic. I have one or two problems that I did not have with OS 7.5,
but this is more likely to be because I am now using a clone. In fact,
if anyone can explain the message "Cannot hide address $FFFF0000 on this
machine. Programs that access this will not run correctly" I would be
grateful. It seems likely that the couple of programs I have found so
far that used to work and now don't are running into this.

Another important question is whether MM works properly with the G3
machines - also whether it works with OS 8.1, in particular with the
HFS+ filing system.

I doubt if SpeedDoubler and MagicMac can work together at all (though I
know that some features of SpeedDoubler can be used, and are useful,
they are not the main feature). Both of them are trying to provide an
emulation of 68000 code on a PPC, and it's not surprising that they
clash.

My Falcon MKI has an RCA (RF) output which connects directly to a TV
set (via RCA to F connector adaptor). My original question was of a
price nature since i've seen NTSC to PAL converters for $50.00 (US)
but PAL to NTSC for $300.00.

In th UK, look for The Upgrade Shop (01625 503448). They should have all
that.

There's no upgrade for LS120 drives at the moment, but you can use a SCSI
ZIP, so why bother ?

Cheers,

FIRST THE SOFTWARE:

1. TRUEPAINT V 1.02 $15 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B\W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $15 (Falcon).
Needs Multitos.

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female) so you
can plug in to your external ampolifier. No need for pre-amp. It will go with
hayes modem/cable and the famous beetle mouse!. $50

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $30.
(has original PC software)

3.Atari PS for external Disk Drive $8

4.external PS for the 520ST $7.00

5. SC 1224 color monitor. It needs video cable; works fine. $16

---------- NOT ATARI----------
1. SM 57 Shure microphone $ 70. (cable+ desk stand included)
2. Akai Open reel tape, Hi Q sounds, head ok. 4ch. $ 50
3. Tascam 4ch mixer(line in/mic/attenuator) +tape recorder/dolby. $30

Free stuff (with the buying of any of the items :) :

Free manuals:
HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments
Atari falcon AFM; D2D; SAM.
Imagecopy 2
Pagestream 2 quick start manual

- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.

If interested send ZIP code to ask UPS for charges.. For software, I can send it for $3.00 US priority mail. (if you are in the US; I am willing to send abroad also) Regards, Phil.

Best prices I've seen are from an outfit in Minnesota. I think they're called National Computer Service. Unfortunately, I don't remember the number. Someone else will have to provide the name of the company that made the SLM for Atari (that's how NCS knows what to send you).

Nope, I used to put 60 meg drives in the Megafile 30s all the time.
Maybe you had a non-RLL drive or a bad drive? The 204 should take any
MFM drive. Basically, 20 meg Atari hard drives are MFM, 30 and 60 meg
are RLL, and the Megafile 44 had a Syquest drive, so I'm assuming it
must be SCSI.

Ah, so I'm not _totally_ insane! You might try System Solutions or the like in Europe, maybe you could get one for more like $150, with shipping. As I recall, in Japan I saw basic PAL/NTSC converters for Playstation, etc for $75.

Good luck!

Dan

Right. Here's the scenario:
Currently living in the same house as me, I have two
friends. Both have two PCs linked as a LAN using a TCP/IP
network.

The problem:
I'm stuck with an ST. Is it possible, and if so,
what do I need to get (h/ware and s/ware wise) to connect my
computer to their network. Thanks.

From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <6b0ueu$ne@bgtnsc03.worldnet.att.net>
Source record: 14269

I've got a Nova 32 in my TT and am having trouble with the latest drivers. I'm also wondering if it is possible to use the Nova concurrently with the Riebl VME ethernet card and if there is a way to use the Nova under Linux.

Does the company that made the card still exist, or is there anyone from the company who is willing to help those who still use their product?

Thanks in advance,

Dan

Okidoki. I've got that done. STiNG is working fine on the ST. That's
the easy part. :-))

>If you're talking about accessing the Internet through the NT machine, you
>need to do proper routing on NT's side, and you need a proper IP address
>for the ST.

I have installed "dialup networking serial cable between 2 PC's" (I
can see no other solution short of sticking two modems back to back)
which is currently dial-out only (from NT's point of view). I assume
this is the reverse of what is required. Therefore, changing this to
"dial-in only" brings up a form entitled "RAS Server TCP/IP
Configuration". It has the following elements upon it:

'Allow remote TCP/IP clients to access:'
a) Entire Network.
b) This computer only.

I have (b) checked simply because NT will not allow (a) as it cannot
find any networking card.

Next section is in two parts: either
"Use DHCP to assign TCP/IP client addresses"
or
"Use static address pool".

I haven't a clue what DCHP is and doubt that such a server is running
or available so I've got the "static address pool" checked. The
following is all the help I can find and it is a bit too vague for me
to figure out with certainty ...

[start help]
If a DHCP server is not available, a range of IP addresses can be
given to a RAS server for assignment to clients. The range must be
valid for the subnet the RAS server is in. Type the beginning and

ending addresses of the range in the appropriate box. You must assign at least two IP addresses--one address is for a remote client and one address is assigned to the network adapter on the RAS server.
You can exclude addresses within the range given to the RAS server by completing the From and To addresses and then clicking Add. Remove excluded ranges by selecting the range to exclude and then clicking Remove.
[end help]

The final item on the form is "Allow remote clients to request a predetermined IP address". This sounds the easiest - apart from there is no mention how this is accomplished!

So, I guess I'm asking for some range to enter into the static address pool. The demon ISP domain is 158.152.*.* and if it is of importance I have a fixed address of 158.152.224.11 although I obtain it with $GET_IP currently.

Once I connected and verified things were ok (ping/traceroute) and an irc connection (lp_irc) worked fine, I entered my login name for PAP_ID and my password for PAP_PASSWORD which I hope is the correct thing to do (I've never used PAP before) but how can I tell PAP is being used or not? I believe NT must have PAP negotiation else there isn't a hope of it listening to inbound connections.

Thanks for any info you can give me Peter!!!

Hallvard.

I really appreciate your effort updating and posting the FTP site
list. Your list is a very useful reference to look for software in the
INTERNET, and this is specially true for newcomers. Maybe you can post it
just when there are changes, but in that case it would be good if it's a
reference to it in the FAQs.

: Here's the February 1998 update of the FTP site list.
: No changes so far, even though Hensa in the UK have announced that their
: site will be closed down. But for the moment it's still running and having
: checked it a few moments ago the Atari software is still there.
: Perhaps this will change soon, but until then the list stays unchanged.

: By the way... is there any use for my FTP site list any longer? Does anyone
: use it at all or are my updates and postings just a waste?
: I'm wondering since virtually nobody responds or comments the list any
: longer, so this might mean one of two things:

: 1) the list is needed by the Atari community, but everything looks fine,
: the links work OK and the list is useful, so there's no need to comment
: anything.

: 2) nobody uses it any longer...

: I'd like to hear if you all need continued support for this list, if I only
: need to post new lists when there are changes (instead of regularly once a
: month like I've been doing for a while now) or leave the list like it is..
: What do you think? I have no idea what the Atari public thinks about the
: list so I need to ask :-)

: Anyway, here's this month's list, with no changes since last month's.
: Enjoy!

: Hallvard

I'm having trouble getting a 720K floppy drive to work with my Atari STFM.
The original drive's heads are damaged so I'm trying to fit a SONY drive
Model MP-53W-30D which is switchable from Drive 0 to 3. The drive will work
on an old eight bit Tatung Einstein but only and reads the directory on
the Atari and returns a 'drive not ready' error after that. When formatting,
the drive stops after formatting the first few tracks. Any ideas?
Thanks

Andrew

Nova's VDI driver is written by Gerhard Huber of Computerinsel. You can
contact him directly at one of these -- hopefully bot-proof -- addresses:

CiEBV at aol dot com

or

Gerhard_Huber at la dot maus dot de

I don't know about the Riebl VME ethernet card, but evidently the Nova
cards aren't being made anymore. Computerinsel seems more PC-oriented,
with their Photoline program now ported to Win95 (I assume the TOS version
will continue along with it). The company's URL is:

http://www.ciebv.com

I don't know enough about Linux, but I'll venture a guess and say that
because it's an OS, it would have its own video drivers. GEM and its VDI
might not be needed? On the otherhand, Linux runs on a 256-color
Falcon -- I can't see why it wouldn't run on a 256-color TT. Even if VDI
is needed, both the Falcon and a Nova-equipped TT would be using
supposedly compatible VDIs.

This is the case for me. I use it quite often when hunting for
software. If you can keep up the monthly posting I'm sure it's useful
for newbies who haven't got themselves fully sorted for web access
etc. This gives them a clue as to where to go to get themselves a full
set of net programs for a start. As you don't find Atari programs
everywhere using your list can cut out a *lot* of frustrating and
fruitless searching.

Keep up the good work!

John

4296. TT030 and HD

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-01 00:00:00 UTC
From: schrist@interlog.com
Message-ID: <6b170p$93e@shell1.interlog.com>
Source record: 14281
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Next question...

I have a TT030 (with CaTTamaran) 16M TT RAM, 2M ST RAM
TOS chip set (TOS C301927-005)

I have an original 50M internal which works fine.

I recently purchased a Seagate ST32430N - Hawk, 2G

I want to replace my current (50M) HD with the new 2G HD. When I disconnect the current internal and connect the 2G and boot. All seems fine. I boot of a floopy with ADHI 6.061 which reports the drive as SCSI 0 - ST32430N. So all looks good.

However when I run HDX (5.04 - if I remember correctly). The program loads. So I choose format the drive light continously flashes (upto this point it flashes as expected - whenever accessed like when ADHI checks). On the screen it says it's checking for devices. My machine isn't locked up because I can move the mouse (a busy bee at this point. However, it never gets to the point where I can select the device to format (after hours!!).

If I run the same program with my old internal I can go threw the same process but the device list comes up.

WHY!?!?!?!

Currently the jumpers are set as:

SCSI - 0
Enable Terminator - on
Parity Option - on
Terminator Power from Drive

This the defaut setting. I tried setting Parity Option to off, but it made no difference.

Since I had no idea what Terminator Power from meant I tried the 3 other settings:

Terminator Power to SCSI Bus and
Terminator Power from SCSI Bus.

I've played around with various terminator Powers and Parity options. Rebooting after each. However, without any luck.

None of the pins are bent. I've also made sure pin one on the mother board connects to pin one on the HD. I've even tried 2 different ribbon

cables... Both of which work fine with the current internal. I only get a problem with the new SCSI device.

Anyone have any sort of suggestion?

The fact the light keeps flashing when scanning for the devices to me, indicates it see the device. However, it's as if the device doesn't repsond "correctly" back. So it requires the device for ever and ever (I've let this run well over 4 hours).

The new HD is SCSI 2 fast but is SCSI compatible.

HELP! Please. I've already had to return a previous 2G HD as it was just pain dead... (It didn't respond at all).

What am I missing?

Agreed, but I'm only using two cables - an ICD one from the Atari to the Link (which has always worked fine), then the MiniS --> Zip is by the official Iomega Zip autodetect lead (and a 50-->25pin convertor also made by Iomega especially to link the autodetect cable to a 50pin SCSI socket). So I have to assume the leads are of Ok quality...

Paul wrote:

> Did you try putting the Minis (when it was terminated) at the end of
> the chain initially or do you not have the cables for it?

I haven't tried this for two reasons - firstly, it would involve buying about 30 quids worth of extra cables, and secondly, the Zip connection won't power the Link2 because it doesn't supply termpower. Is there a simple way of providing termpower to the Link without getting a soldering iron out? (my knowledge of electronics is not great, so I'd rather not tamper on this level!) If so, then this is certainly something I would like to try (especially if I can't get it to work any other way)

> As the chain is, maybe you should check the dip switches on the Minis
> and check that it is supplying TERMPOWER too.

Yes, the MiniS supplies termpower. There are two sets of jumpers on my drive, one set for determining the SCSI id, and the other set that controls termpower, parity, "power up option" (??) and "reserved". I have experimented with different combinations of jumpers but nothing helped... :(

I've got a SCSI terminator ordered from Maplins that should arrive on Monday, so I'll stick that on the Zip and pray that it works...

Thanks for everyone's help so far, I appreciate it - maybe one day I'll get the damn thing working..! :)

A classic case of not knowing if its worth the effort, Web pages are
the worst, all them hours getting them right and not knowing if anyone
used them,

Why not stick a counter on the page? then at least you will see people
are visiting it...Geocities do allow a counter don't they :)

BTW Yes I use it...have done for as long as I can recall :))

Have you heard of PARCP ? IMHO, it's the best way to connect an Atari
together with a PC. It's fast (approx 80kbytes/s) and reliable (since
version 2.50). What you need to use it is a parrallel connection cable, and
a preemptive multitasking OS on your Falcon like MultiTOS or Magic. You can
even use it to transfer between your Falcon and your STe if you want. The
only inconveniency to this system is that if you use a printer and have no
LPT port unused, you'll have to disconnect your printer while you transfer.
PARCP is a 10 UKP shareware (worth the money)
Normally, you should be able to download it from
http://ft3.zlin.vutbr.cz/stehlik/home.htm
or
ftp://ftp.zlin.vutbr.cz/pub/atari/parcp/
It is supported by CyberStrider
http://www.cyberstrider.org
PARCP author's E-mail
stehlik@cas3.zlin.vutbr.cz

The programs that used to work and now don't (and I don't know if this is OS8 or my clone) are MagicMac's own clock program, rather surprisingly, and the comms program Connect. I noticed somewhere - I think it may have been in the docs for HSModem reference to programs accessing the address $FFFFxxxx, which was the area MM remarked about on my clone.

I don't think Touch-Up ever ran on MM (not quite sure, it certainly hasn't run for some time). Loads of programs do run, but one can't expect anything that addresses hardware directly (games, music are likely to be of this kind) to work.

The new Mac filing system HFS+ may cause troubles for MM, as I understand several major Mac programs can't deal with it as yet - new versions may be as much as six months away. I'm sure they'll deal with it in time, but it would be useful to know what the situation is.

For those always looking for hardware information, a good general source can be found at the Apple Tech info site. While not directly related to Atari computing, I have always been able to find a wealth of general information that I can apply to hardware questions concerning my Falcon. It has a nice search interface (ie, search for anything SCSI) is viewable with CAB 1.5 and is the faster server I have ever visited from where I sit. One point of interest is the coverage concerning third party hardware and items of interest such as SCSI termination.

Not an Apple plug, just pointing out a free resource for Atari users at Apples expense:).

4305. TT030 and HD

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-01 00:00:00 UTC
From: james.burr@acpu.com
Message-ID: <886375723@acpu.com>
Source record: 14290

-> I have a TT030 (with CaTTamaran) 16M TT RAM, 2M ST RAM
-> TOS chip set (TOS C301927-005)

-> I have an original 50M internal which works fine.

-> I recently purchased a Seagate ST32430N - Hawk, 2G

-> I want to replace my current (50M) HD with the new 2G HD. When I
-> disconnect the current internal and connect the 2G and boot. All seems
-> fine. I boot of a floopy with ADHI 6.061 which reports the drive as
-> SCSI 0 - ST32430N. So all looks good.

-> However when I run HDX (5.04 - if I remember correctly). The program
-> loads. So I choose format the drive light continously flashes (upto this
-> point it flashes as expected - whenever accessed like when ADHI checks).
-> On the screen it says it's checking for devices. My machine isn't locked
-> up because I can move the mouse (a busy bee at this point. However, it
-> never gets to the point where I can select the device to format (after
-> hours!!).

-> If I run the same program with my old internal I can go threw the same
-> process but the device list comes up.

-> WHY!?!?!?!

-> Currently the jumpers are set as:

-> SCSI - 0
-> Enable Terminator - on
-> Parity Option - on
-> Terminator Power from Drive

-> This the defaut setting. I tried setting Parity Option to off, but it
-> made no difference.

-> Since I had no idea what Terminator Power from meant I tried the 3 other
-> settings:

-> Terminator Power to SCSI Bus and
-> Terminator Power from SCSI Bus.

-> I've played around with various terminator Powers and Parity options.
-> Rebooting after each. However, without any luck.

-> None of the pins are bent. I've also made sure pin one on the mother
-> board connects to pin one on the HD. I've even tried 2 different ribbon
-> cables... Both of which work fine with the current internal. I only get a
-> problem with the new SCSI device.

-> Anyone have any sort of suggestion?

Try to find HD Driver v6.0 and try it. I know Ataris can handle HDs that large but some of the older drivers I've been told can't. I have a Falcon with an HP Coyote 1.4 meg + a Quantum 104 meg + the internal 65 meg IDE. I tried using HDX that came on the Falcon's language disks and it couldn't format the Coyote properly. I heard HD Driver 6 was good as it it the latest one out but I'm using ICD HD Utilities for now and it works fine. Also try removing the jumper or flip the dip switch to TERMINATION to off. Not the Termination power, the termination resistor. My old ST and this Falcon hate termination resistors.

Call Systems For Tommorrow @ (800) 875-4943 for HD Driver 6.

Later,
James

Omitting the modems and do a direct null-modem cable connection is better,
you can use higher connection speeds for instance, and is less work.

> which is currently dial-out only (from NT's point of view). I assume

Dial out is ok if you can convince NT to use a given static IP address.

> Next section is in two parts: either
> "Use DHCP to assign TCP/IP client addresses"
> or
> "Use static address pool".
>
> I haven't a clue what DCHP

Dynamic Host Configuration Protocol : DHCP, not DCHP !

is and doubt that such a server is running
> or available so I've got the "static address pool" checked.

That's better indeed.

> The final item on the form is "Allow remote clients to request a
> predetermined IP address". This sounds the easiest - apart from there
> is no mention how this is accomplished!

Probably PPP was meant, which does precisely this. You should use
something like 192.168.1.1 - 192.168.1.2. One is for the NT machine,
the other one for the STinG machine.

> So, I guess I'm asking for some range to enter into the static address
> pool. The demon ISP domain is 158.152.*.* and if it is of importance I
> have a fixed address of 158.152.224.11 although I obtain it with
> $GET_IP currently.

You need to use addresses that do not exist in the Internet. The
192.168.x.y networks are reserved for precisely this purpose.

> Once I connected and verified things were ok (ping/traceroute) and an
> irc connection (lp_irc) worked fine, I entered my login name for
> PAP_ID and my password for PAP_PASSWORD which I hope is the correct

These are the ones used for logging into NT ?

> thing to do (I've never used PAP before) but how can I tell PAP is
> being used or not?

Check out the DEBUG.LOG that get's written by the Dialer if you use it
for establishing the connection.

Depends on what kind of network they use. It's probably Ethernet. Few
Ethernet adapters for Ataris are available at the moment. I'm currently
working on a STinG driver for the Riebl Ethernet adapters, it's getting
close to completion.

Cheers Peter

AHDI doesn't support SCSI drives larger than 1 GByte. The same applies
to HDX.

d> unplugging it the drift stops, but I did open it and cannot find
d> anything loose or wrong. This is very nasty sometimes when a fine
d> movement is required. Any ideas?

While we're on the subject, any mouse plugged into my Falcon keyboard causes the mouse pointer to go all screwy. It refuses to go left, and often goes in directions you're not asking it to. The left button also tends to act as if it's pressed down, even when it's not. My STE keyboard works fine in the same Falcon.

Anyone have any ideas what's wrong with my Falcon keyboard?

This was one of the things I inquired about when I first posted my
problem. MagiC has a lot of things that it can do that aren't
covered in the English documentation. The environment variables
aren't explained well at all, and I was wondering if there was some
flag that had to be added/changed to MagX.inf to make the alias work
correctly.

Tim,

I had this problem on my MegaSTe once. It's the mouse cable.
There's probably a short near where it enters the mouse; that's where
most of the stress goes. I cut of the bad end and resoldered the
connections to the mouse pc board. It's tedious, but it worked fine
afterwards.

I'm pretty sure I used to have the Link plugged into my Zip and the Zip
connected to my HD, I know the link doesn't supply termpower but your HD
should and it's a chain...

> Is there a simple way of providing termpower to the Link without

> certainly something I would like to try (especially if I can't get it
> to work any other way)

With my Zip from HiSoft they provided a cable from the Joystick port to
one of the ports on the Zip, it would probably involve a bit of
souldering but only to wires and plugs...

Same problem here. I have a Falcon with a TT keyboard and a beetle mouse.
I think that the problem is in the mouse hardware because unplugging it
the drift stops, but I did open it and cannot find anything loose or wrong.
This is very nasty sometimes when a fine movement is required. Any ideas?

Daniel.

You might have already checked this, but sometimes the chip on the
underside can work a little loose. A few other things to check are the
cap and resistor that is located near the center. They are prone to snagging
on things like memory upgrades and such. The other, the wires for the
plug, are a bit on the stiff side and it dosen't take much for them to fracture
the solder joint, or break themselves. And as always, check the
connector itself (the one that has made every Atarian cuss from the
first 520:).
As far as the Beetle mouse is concerned, the fragments of mine can be
found about the base of my brick fireplace harth. I stole my kids
Golden Image mouse and never looked back.

From: Kent Johansson <midwinter_SPAMBLOCK_@hotmail.com>
Message-ID: <34d6e689.0@d2o29.telia.com>
Source record: 14160

Hi!

My old Megafile 60 doesn't seem to work. If I have it connected when I boot up I get no icons at all. If I connect it after start up I cant read floppys anymore. If I have my system running and then run ICD boot and plug it in when it's started I get a report that I have a "Adaptec 4000/5000"-something message and the system hangs.

The DMA cable is OK and the harddrive is OK, it seems to be something wrong with the controller bord, anyone know where I can find service manuals for this one? Or does anyone have a CHEEEPP megafile 30/60 for sale in Sweden?

Any hints/advice?

From: s970707@uia.ua.ac.be
Message-ID: <EnszG3.CD8@uia.ua.ac.be>
Source record: 14162

Hi everybody,

I'm using MintNet 1.01 with the appropriate HSMODEM package (from K.Ellis' page I think) to use my Falcon as an intranet server. It all works well, BUT since I'm using serial lines (LAN + MODEM2) for the SLIP connections, I would like to take advantage of HSMODEM.

The problem is : getty supports only baudrates till 19200 Bps. In the ttytab-file is suggested to use mgetty for higher speeds. Fine with me, but how do I configure it ? Should it be run as a background process ? Launched at boot time ? What are really the maximum speeds that can be used under MintNet for those lines ?

Please help !

Thanks anyway,

I never got a Beetle mouse (though I thought they looked cool). I used a Best mouse for YEARS and absolutely loved it. I'm now using a Wizard 560 (dpi) that is also very nice, though tracking is not as good as my Best mouse was (perhaps because of the high dpi).

Unlikely.

If it is, How
>can I Kill it?!

The problem is probably due to a break in the mouse cable. Flex it and watch the screen to find out where - probably close to the mouse itself.

The ST series used to have a similar prob. due to the mouse socket on the PCB becoming unsoldered because of the stress of constant exchange with a joystick. This is unlikely on a TT but you could take a look at the socket on the keyboard PCB.

You HAVE cleaned the mose rollers recently, have you?

I've an STE and I have the same problem. I think it's because the mouse is
a 280dpi Logic3 replacement instead of the 100dpi Atari mouse. What I think
is happening is that the keyboard processor is getting a signal from one of
the sensors in the mouse and thinks it's moving. I'm fairly certain about
this because a slight tap on the desk and the mouse stops dead.

Probably not. Do you have a cat or dog?

>If it is, How can I Kill it?!

Much easier just to keep the animals out the room! ;-)

Seriously, if you get a hair inside it (or even dust), the mouse can
start wandering like this. My optical mouse is especially vunerable to
it. Try it unplugged. If the problem goes away then it's a good chance
its the above. Otherwise, it might be worth reseating the keyboard
chip. Only then would I suspect a virus of any kind. iirc there is one
that messes with the mouse (ghost?) - UVK can no doubt remove it.

They were, but they were not very popular.

There is now only one manufacturer of 2.88 Mb media (TDK), so I would advise
anybody considering installing one to look at other solutions.

Supposedly, the LS120 is able to read 1.44 Mb floppies, while storing 120 Mb
(I think) on its own special media.

LS120 drives are PC drives that work in a dual mode:

a) They replace a classic floppy drive, reading classic 3.5" 1.4Mb floppies
b) They also take special 120Mb floppies, comparable to EZ135 or Zip drives.

From the outside, they look exactly like an internal 3.5" floppy drive.
Inside, they connect to both an IDE connector and a the floppy connector, and
need the Bios to recognize them. I really doubt they are useable on an Atari.

>Note that TOS 2.06 already knows about ED floppies (2.88 Mb)
>which is detected by a system cookie, but were such drives
>ever manufactured? I have yet to see a Mac or PC with those.

Yes they are, the latest PCs we got at work have either these or LS120's.

I understand that the Ajax chip can support these (maybe by feeding it with a
32MHz signal instead of 16MHz for HD and 8 for DD ?), but I'm not sure about
TOS or a desktop format option.

Has anyone ever done this ?

Cheers,

Nick.

Someone else with the same machine had a problem with Connect. I expect
it is that mysterious message that I got when first running MagicMac on
my new clone "Address $FFFFxxxx cannot be hidden on this machine". I
wish I understood that better.
>
> As for PPC machines and MagicMac, I'm able to use my brother's newly bought

The early versions of MM only worked on 680x0 machines, so maybe the
demo never got upgraded, though I thought I had. As I said, MM works
fine on Powermacs of various kinds and various systems, with most
programs OK and a few giving trouble. What fo you want to run?

Cool - I wasn't sure if termpower was applied to the SCSI bus as a
whole. At least it's something else to try! :)
(The terminator I ordered hasn't arrived yet)

> With my Zip from HiSoft they provided a cable from the Joystick port
> to one of the ports on the Zip, it would probably involve a bit of

I may see if I can get one of these, as it would be nice to use the
Zip without having to power up my other drive (if I can sort the
cabling out - that damn mandatory autodetect cable is a nuisance...)

Thanks Paul...

Hallvard, you too are constantly breaking the usenet thread chaining, by
posting truncated "References:" lines, apparently each time truncated after
the same number of bytes. Three examples from three messages by you in this
thread :

> References: <69hk72$u31@news.iwvisp.com> <69iet6$rf6$1@infomania.emw.ericsson.se>
<69k90i$a62@news.iwvisp.com> <69ko81ppe1@infomania.emw.ericsson.se>
<34bffaae56a3245@post1.com> <69ra89$3se$1@news.campus.mci.net> <34c16cca1d49df0@post1.com>
<34c3ced2443484@pos

> References: <69hk72$u31@news.iwvisp.com> <69iet6$rf6$1@infomania.emw.ericsson.se>
<69k90i$a62@news.iwvisp.com> <69ko81ppe1@infomania.emw.ericsson.se>
<34bffaae56a3245@post1.com> <69ra89$3se$1@news.campus.mci.net> <34c16cca1d49df0@post1.com>
<34c63372d0c24@post

> References: <69hk72$u31@news.iwvisp.com> <69iet6$rf6$1@infomania.emw.ericsson.se>
<69k90i$a62@news.iwvisp.com> <69ko81ppe1@infomania.emw.ericsson.se>
<34bffaae56a3245@post1.com> <69ra89$3se$1@news.campus.mci.net> <34c16cca1d49df0@post1.com>
<34d3594e130e406@po

The last is the one taken from the message I'm replying to here.

You'll note they are truncated after 256 bytes. Taken from another (correct)
one by you from this thread :

> References: <69hk72$u31@news.iwvisp.com> <34c16cca1d49df0@post1.com> <34c3ced2443484@pos
<34c63372d0c24@post1.com> <6ack19$14i$1@nyheter.chalmers.se>

This line wasn't long enough to trigger the problem.

I believe this is not your fault, but the one of the news reader you're
using :

> X-Newsreader: Okami Newsreader Version 0.28

or the client you use for posting. Which one is it ? Is that Okami version
the official one or the unofficial ?

Please do the following. Try to find out if this is a problem of the reader
(Okami) or the posting client, by examining the messages generated by Okami
BEFORE they go to the posting client. If you find non-truncated "References:"
lines longer than 256 characters, then it's the posting client. Whatever it
is, please bug-report to the author of the faulty part.

Cheers Peter

Me again,

Thanks everyone who helped with my HD problems... It seems ADHI just
cannot handle 2G HD. I tried the demo version of CBHD and HDDriver
to actually access the drive.

Anyway, the next thing I want to fix is the battery. The clock hasn't
been keeping time since I got it. I looked at the battery and it says
it's a 3.6V. I did a quick check at my local Radio Shack (OK , I admit
not the best store) and they didn't have the model of battery.

Does anyone know what the specs are for the TT battery. I have a few
places I want to shop downtown (Toronto). However, I have no idea how
many amps it should be. Or exactly what the connection is called other
than it has three holes.

Stephen,
If your battery is original it will be a black plastic object, square when you look at the end and a little longer than a AA batter with wires coming out the end. That's because there is a AA size battery inside. As you say, it is 3.6 volts, so it is not a standard AA battery. I believe it is a Lithium battery, if memory serves me. Anyway, carefully pop the cap of the end of that box where the wires exit and you will be able to remove it. Take this to a shop that specializes in batteries and they should either have it in stock or be able to source it for you. You'll find they recognize this far easier than they do the packaged unit. The battery shop I got mine from, here in Calgary even resoldered the wiring harness on to the new battery for me, and the price is far cheaper than you would pay for the fully packaged unit. Hope this helps you out.

I have looked through various ST FAQs, but I have not come across
any information on how to run a diagnostic test on a ST/STe/etc.
I want to find out how much memory the machine has, perhaps the
operating system version, run a self-test?, and other basic diagnostic
operations.

Is this information located anywhere?

Someone please help.

AFAIK, it's just a matter of changing some jumpers on the floppy,
to have it recognized as a 2.88 Mb. However, even though a cookie
reports the possibility, obviously one would need a formatter, as
Newdesk itself has no provision. Something like ForMiNT could be
easily modified.

Are there any ways of connecting an ST (520 with 1 or 4 megs of RAM) to an ethernet? I need to connect it to my PowerMac as a bridge to the internet. I'm running a flavor of UNIX on it that presently doesn't have serial support, the only way out is through the built-in ethernet.

In Atari circles it's known as a 'DMA cable'.

It is just a straight-through (pin1->pin1 etc.) 19-way connection via a couple of 19-pin male D-connectors. You could make one yourself if you don't mind the boring soldering job. Don't make it too long (less than 60cm.) and use good signal cable as the DMA is prone to noise and loss.

You can run a small utility like sysinfo. It can be found on most FTP sites.

Usually, if the machine hasn't been modified, you can tell by what's on the
front sticker.

Cheers,
Nick

o> files.
o>
o> Is there a way to configure Ease to do this? If not, is there any
o> program I can add to Ease that would allow me to do this?

I'm sure I saw this somewhere, and duly found it inthe translation I did of
CLOCK.APP from the Magic disribution.

I'm not sure if this requires the Desktop to support AV/VA, but it doesn't
sound like it does. I'm less sure that you can send any file via CLOCK.MUP
or whether you're forced to specify it - maybe there's a way of frigging it
through Mupfel, which I've never used.

=====
+ Alarm Time:
CLOCK.ACC can now send an announcement to Gemini, at a configurable
time, that the file CLOCK.MUP on the boot drive will be executed.
You should enter the program to be started and its parameters in the
file CLOCK.MUP. In this way you can set, for example, an alarm call or
call your BBS Mailbox. This only works if Gemini is active and the
clock window is open.
If you prefer that the alarm function is inactive you should leave the
alarm time input field empty.
A small marking appears in the clock face if the alarm time is active.
After changing the alarm time the current Status should be saved with
'Control-S' so that the new alarm time is not lost at the next reboot.

Structure of the command line that will be passed to CLOCK.MUP:
$0 : Contains the full path name of the CLOCK.MUP file
$1 : Contains the version number of CLOCK.ACC
$2 : Contains the full path name of the CLOCK.INF file
$3 : Four digits of the alarm time
$4 : Six digits of the time of day
$5 : Eight digits of the date

In CLOCK.MUP you can overwrite the files CLOCK.INF and CLOCK.MUP with
other files, so like this eg. a new alarm time and a different alarm
program can be preset.
```

If CLOCK.ACC receives the VA_PROGSTART Message, CLOCK.ACC reacts the same as with the 'UNDO' key. The possibly altered CLOCK.INF file will thereby be re-evaluated. In this way it is, for example, possible that several programs can be called at different times of the day. It is also possible this way to have differently timed alarms on successive days.

There seem to be some Ethernet cards available in Germany somewhere. Other than that...

Cheers,

Nick.

I wouldn't know about Europe (I'm British, not European ;-)), but
doesn't NTSC stand for "Never Twice the Same Colour"?!

Yep, that's Mickysoft's cryptic way of saying there's a null modem
link. I should have been clearer!

>> which is currently dial-out only (from NT's point of view). I assume

>Dial out is ok if you can convince NT to use a given static IP address.

It's now dial-in. I couldn't set it before because I didn't know what
to put in the form that came up next (the one below).

>> PAP_ID and my password for PAP_PASSWORD which I hope is the correct
>
>These are the ones used for logging into NT ?

What I meant was, I got STiNG working fine on the ST with a standard
dialup. I haven't the foggiest idea what info NT wants for logging in.
I haven't got that far yet.

>> thing to do (I've never used PAP before) but how can I tell PAP is
>> being used or not?
>
>Check out the DEBUG.LOG that get's written by the Dialer if you use it
>for establishing the connection.

This is where I'm stuck now. There is an option in the Administrative
Tools, "Ras Admin" which brings up a form on which the current port
status is displayed. Initially it says:

Modem condition: Normal.
Line condition: Waiting for call.

Reguardless of what I did with STiNG the above did not change and
STiNG wrote no debugging information. After a lot of fiddling, I found
that if I enabled STiK instead, and ran PopWatch, the above did change
(I forget the exact text but it was to the effect "there is an
incoming call"). Nothing further happened of course because STiK isn't
capable.

I assume that STiK accomplished this by blindly sending data when
PopWatch told it to, whereas when PopWatch runs with STiNG it refuses
to attempt connection because it gets an error back from STiNG (which
PopWatch reports as "there is an error").

Methinks it is obvious i've messed up the STiNG configuration but
what? I has hoping to just boot the ST and run a client - whereupon
STiNG would start pumping data to NT, hopefully preceeding it with the
PAP stuff. This doesn't seem to happen so is the PAP negotiation part
of the Dialer? If so, how the heck to I bypass all the modem stuff in
the dialer because no amount of fiddling by me will get the dialer
through the (unrequired) script phase.

I'm getting there slowly!!! :-)

>>
>>This line wasn't long enough to trigger the problem.
>
> I have no idea what you're talking about :-(
> This is too Internet-technical for me, please explain in layman's terms.

It's not very technical in fact. These "References:" lines provide the link
to other messages, the "parent messages" if you wanna call them so, the message
you have replied to. In Usenet, usually the parent of the parent, and occasionly
even the parent of that one is included too for news transport reasons.

There is some part on your side that cannot handle the situation that this
line gets too long, exceeding 256 characters. The line is truncated by your
software in that case, which means no other newsreader can read that line
properly, so the linkage to the message you've replied to is missing. Hence
such messages appear as if they start a completely new thread, which is
annoying if using a reader which supports threading.

Usually you're not shown these lines by default. You must tell your reader to
display full header to see these lines.

>>I believe this is not your fault, but the one of the news reader you're

There are two versions of Okami : The inofficial one by Jos den Bekker and
the official one by Michael Schwingen. Check out who is mentioned by your
version.

> 1) get online using "Connect" with my provider's UNIX computer.
> 2) issue a UNIX command to fetch all my mail/news messages as a SOUP packet

>
> 3) disconnect
> 4) "import" the SOUP packet into Okami using a script
> 5) all messages are sorted into groups -newsgroups and a mail group so I
> can read/reply messages without being online.

Ok, so it's unlikely that it's not Okami. Which means you need to find out
which version you're using, and see if there is a newer one, and if not,
report to the author.

> 1) after having written all the new messages and replied to the ones I want
> to reply to I exit Okami and run the "export" script.
> 2) all messages are collected together, and made into a SOUP reply packet.

This means this export script could be the culprit too. Load the files that
go in to, and come out from, this script into an ASCII editor capable of
displaying lines longer than 256 characters, and look for the lines that have
the word "References:" in the beginning. You can check the '<' and '>' brackets,
they are not nested, and a '<' must be followed by a '>' later on, if the line
is not truncated.

> I'm not familiar with the "references" you're talking about... how are they
> supposed to be?

The general syntax of such a line is

References : <[alphnum]@[domain]> <[alphnum]@[domain]>

There can be more than two entries (and must be in a truncated line). [alphnum]
is a string of alphabetic and numberic characters, occasionly a few special
characters are used too, but never '<', '>' or '@'. [domain] is a usual Internet
domain name, like 'post1.com'.

> What I'll do is forward this message to the maus.Okami newsgroup since the
> author is there

Only the author of the official version is there. Jos is not there AFAIK ?

Cheers Peter

What I should have said, Ronald, was that continuous _active_ access
to the EZ caused heating problems (like, when copying a large amount
of files to or from it), not simply keeping it running, as I still do.
But that might apply only to my own set-up, anyway. I hope the
original poster got his problems solved: I have enough of my own,
hehe.

Kobold v2.5+ should be able to handle 2.88Mb floppies. I'm not sure if
the formatter in Magic is able to. It may do since it allows the selection
of upto 99 sectors per track (?) and 99 tracks, although these are probably
because someone forgot to put a lower, more sensible, limit on them.

Oh, okay-sorry if I misunderstood. Hmm...I wonder though-on the Mega ST that I use to run my BBS, I copy the entire C:\ partition to L:\, which is my EZ drive with no problems either. Its around 75 megs or so...only thing I notice is tha the copying process tends to slow down the further along it gets. I'm using ICD's Pro Utils., and my understanding is that if I was using HDDriver, this would improve. Oh well...I know its not a speed issue-I'm quite happy with the EZ's speed, and the drive I'm copy -ing from is a new Ultra-SCSI 4.5 Gig drive...

So what other problems have you encountered with your Hades? Like most dedicated Atarians, I'm very much interested in the latest generation TOS machines such as the Hades, DirecTT, Milan, etc,... I've heard that sound is a problem (lack of) with the Hades, is that true? Thanks for any info! ;-)

Hello,

Dans l'article <6bgrb2$o91$1@news.campus.mci.net>,
Ronald J. Hall, <thechyld@pcc-uky.campus.mci.net> a crit :

> So what other problems have you encountered with your Hades? Like most
> dedicated Atarians, I'm very much interested in the latest generation
> TOS machines such as the Hades, DirecTT, Milan, etc,... I've heard that
> sound is a problem (lack of) with the Hades, is that true? Thanks for
> any info! ;-)

Personnaly, the only problem was the one mentionned : spurious
interrupt when using SCSI for big tranferts. The matter seems to be a too
old chip on the mother-card (I've one of the first Hades...), but as I can't
contact Medusa I still not have the replacment chip so...
I've heard of other SCSI problems, on newer Hades, but corrected by
software enhancment, so...
Sound is not a problem if you have enough money to buy the
Startrack card, I think. Personnaly, I don't use sound so...

The problem of the EZ itself is not solved : the sailor can't
reproduce the error :-(May be a matter of heating, like described in the
precedent message of Charles.

Thank's for all informations,

Source record: 14213

I just got a 520STF and a 1040STF from second hand stores cheap. I wanted to run some color games however I only had a composite color monitor to use and the 1040 didn't have the composite video at the plug. The 520 did but had only a single sided drive. So I swapped them. When I had the machines open I noticed that the connectors for the drives seemed to be the same as standard 720 and 1.44 meg ibm clone drives. Can I just plug in one of these drives instead of the atari drive? Are the plugs for power and data pin compatible?

No. There is no emulator right now that can access Midi ports. Cubase also
needs a dongle cartridge, and there is no Atari cartridge port on PCs.

TOS images are illegal. Please don't ask for help if you can't figure that
out.

In another post you ask about doing D2D on an STE, so if you have an STE,
you can make a perfectly legal TOS image with the MAKETOS program that's
included in PacifiST (http://www.pacifist.fatal-design.com).

```
THE ATARI ST QUICK FAQ - v2.3 / 1998-01-29
The 'Quick' FAQ was initially intended to be a small list of resources made
to
avoid comp.sys.atari.st newcomers asking the same questions over and over
again. However, as the project progressed, and other members of the Atari
community became involved, it simply became bigger and bigger. I doubt it
really deserves to be called 'quick' any more, but hopefully it will still
serve it's original purpose.

HTML/WEB - FRANCE http://wwwperso.hol.fr/~nbales/quickfaq.htm
HTML/WEB - USA http://www.geocities.com/MotorCity/2090/quickfaq.htm
TEXT/FTP - NORWAY ftp://ftp.sol.no/user/hallvart/atari/info/quickfaq.txt
ZIP FILE - USA http://www.geocities.com/MotorCity/2090/quickfaq.zip

If you cannot access any of these, but wish to receive a copy of the FAQ
through e-mail, send a message to the following autoresponding address:

AUTORESPONDER bales@garonne.stortek.com
Note: The subject line must be: ATARI FAQ REQUEST

Cheers,
Nick.

> . . . Does anyone know what the specs are for the TT battery.

Some years after the TT came out the backup batteries began to fail and there was confusion as to whether the replacements should be 3.6 volt or 6 volt. I found that 3.6 volt was *not* right and at present have a 6 volt lithium backup battery with leads from Maplins which is working well. The part number is AS44X. I understand that Quality Kits of 292 Queen Street, Kingston, Ontario K7K 1B8 tel 613-544-6333 distribute their stuff but I would imagine that any computer store would have an equivalent. I have to solder the leads together as I had previously cut the plug off the end of the computer cable. Can't remember why :-)

HARDWARE

1.ST 1040F 1MB ram. This machine has an audio output jack (RCA female)
so you
can plug in to your external ampolifier. No need for pre-amp. It will go
with
hayes modem/cable and the famous beetle mouse!. $50

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc.
$30.
(has original PC software)

3.Atari PS for external Disk Drive $8

4.external PS for the 520ST $7.00

5. SC 1224 color monitor. It needs video cable $16 (I can give you one
that needs
a connector at the other end (free).

SOFTWARE:

1. TRUEPAINT V 1.02 $15 Excellent drawing program; all resolutions and
colors. Works in ALL
ataris. From B\W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will
send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations
audio-video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol
CD-ROM $15 (Falcon).
Needs Multitos.

---------- NOT ATARI----------
1. SM 57 Shure microphone $ 70. (cable+ desk stand included)
2. Akai Open reel tape, 4ch. $ 50
3. Tascam 4ch mixer(line in/mic/attenuator) +tape recorder/dolby. $30

Free stuff (with the buying of any of the items :) :

Free manuals:
HD Driver 4 rev 1.1 1/96
Deskjet utilities pack v 1.2
Calendar and appointments

Atari falcon AFM; D2D; SAM.
Imagecopy 2
Pagestream 2 quick start manual

- Omnires Monitor emulator for the ST.
-External floppy drive 1DD good case/mechanism.

If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US priority mail. (if you are in the US; I am willing to send abroad also) Regards, Phil.

> This is where I'm stuck now.

You'll need to use the Dialer to get a debugging log.

> There is an option in the Administrative
> Tools, "Ras Admin" which brings up a form on which the current port
> status is displayed. Initially it says:
>
> Modem condition: Normal.
> Line condition: Waiting for call.
>
> Reguardless of what I did with STiNG the above did not change

It should, if you used the 'Port Setup' CPX to activate the relevant
serial port for PPP. I assume you've set the serial port parameters
using SERIAL.CPX ? Then open the 'Port Setup' CPX, flip to the 'General'
page of the serial port, and check PPP, then click 'Active', and OK.
NT should notice now that "there is an incoming call". As this is a fixed
line, there is no need for PAP, so you should configure NT to use PPP
without PAP.

> Methinks it is obvious i've messed up the STiNG configuration but
> what? I has hoping to just boot the ST and run a client - whereupon
> STiNG would start pumping data to NT, hopefully preceeding it with the
> PAP stuff.

The PAP stuff is not essential, but LCP is. For PPP, LCP stuff must be
"pumped" first. This is done as soon as the link is activated, either
by the Dialer, or the 'Port Setup' CPX.

> This doesn't seem to happen so is the PAP negotiation part
> of the Dialer?

No, but currently you need the Dialer to provide the passwort.

> If so, how the heck to I bypass all the modem stuff in
> the dialer because no amount of fiddling by me will get the dialer
> through the (unrequired) script phase.

Read DIAL.SCR !! There is the keyword DIRECT which will cause the Dialer
to bypass dialing. Then delete the script, that's all.

Cheers Peter

PaCifiST 0.48 currently has MIDI out support - although this seems rather
restrictive (only SB supported) so I'm not sure if it is actually capable
of outputting to a port, or whether just using the card to synth

> needs a dongle cartridge, and there is no Atari cartridge port on PCs.

Hmm... I probably shouldn't mention the feasability of emulating cartridge
ports... STonX makes use of its own "virtual" cartridge for initialising
a few things.

From: rcain@zetnet.co.uk
Message-ID: <6bl3nf$qk5$1@roch.zetnet.co.uk>
Source record: 14225

There was quite a deep scratch on my monitor so I scrubbed away at it
with fine-grade wet-and-dry emery paper.

I have managed to reach the bottom of the scratch but I'm now left
with a 'frosted' area of screen which will not polish up with the
wet-and-dry.

I have tried using some domestic polishes, metal polish, tooth paste
etc. but these are not having much effect.

Has anyone any bright ideas about what I can use as a finishing polish
to get a good surface back onto the glass?

Thanks.

It could be that the editor he's using, either externally or as part of
Okami is unable to handle lines of more than 256 chars. I used to use
Tempus2, which has a 256 char max line length, so now I use Cbreeze which
doesn't like lines of more than 1024 chars, although I haven't seen many
References lines that get this high.

Hm - I have an idea what might cause this (Okami *should* cut off references
at a correct point, ie. between Msg-IDs, I think after 1K or so in length,
which is allowed).

It might be the "edit message" dialog box which cuts the strings of ... but
I don't have a UUCP or SOUP setup running - I'll have to re-activate my UUCP
connection from this machine to my ST to test, but this might take some
time.

We were talking about the following pages. The main page has other flaws, but
not that one. http://www.atari.de/messe.htm however is white on white.

Apart from that, sure if you've set your browser to a fixed background color
instead of using the color prescribed by the HTML, you'll have no trouble
reading the text. I guess this is what the author did when creating the page.
But the vast majority of people let the HTML code specify the background color.

Yes. In fact, decent news readers like knews for instance draw you a beautiful
graphical message tree, where lines link each message to the one the message is
supposed to be the reply to. For your messages however those readers have to
grow a new tree, and one cannot see easily what your message is meant to reply
to.

> But your previous message where you pointed out the problem with the

John,

The TT030 clock battery is located at the back of the motherboard
just behind the hard drive access cover and ST RAM expansion slot.

It is a standard PC battery type the original is TL-5242/W;
alternatively you can use a COMP-8P.

Not according to the reviews in the PC magazines (i.e., PC Plus or PC
Pro). In their results, reading of standard floppies was actually
SLOWER with the LS-120 than with a standard floppy drive.

4400. TOS/DOS Zip Disk Directory

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-09 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <6bm20d$9r3@thoth.portal.ca>
Source record: 14235

I now have the Zip drive running HDDriver 7.12. Everything works well with the TOS/DOS-compatible partitioning scheme. What I did notice after Win95 wrote only 8+3 filenames to the disk was this in the directory:

Aw. -1 31Mar207 31:63:62
Aw. -1 31Mar207 31:63:62

I've seen the same thing on a few of my TT's HD disks that eventually went 'bad' after Win95 wrote to them. Other than these two hidden files, the integrity of the data on the Zip disk is fine, but I'm somewhat leery from previous floppy experiences. Correct -- the only tool I have right now after being a long-time ICD user -- reports no errors. ICD's Cleanup used to report errors on the floppies in such cases (obviously Correct isn't doing an in-depth analysis).

This, of course, has nothing to do with HDDriver (the source being Win95). But should I be cautious if the above directory corruption occurs?

They are? I looked at them today and I think they look quite nice. There
are a few glitches but they look much better than most pages I have seen
before. They are also under construction. so don't judge them to early.

> It's been the first time that I've seen somebody using white text on a
> white background (!) It's ridiculous.

Where did you find this? On your own pages? ;-)
Seriously I couldn't find this anywhere at all. Tell me where?
BTW. Background colours looks to be something that they havn't masterd
at all. Maybe it's a limitation in the webdesign program they use.

I realy think we should see this as a postive thing as it's not realy
often you see someone making a serious try on making something useable
for Atari users. Look at Wizztronics web pages. They are pathetic and
looks like a bunch of kids have knocked them togheter in 5 minutes.
And these guys are our future? Bha!

If I would bet a penny on any company it would be FALKE Verlag and Milan
GBH. Atleast they try to be professional and for that they should get
or respect.

Well, here I was rambling again... :-)

Well it still looks fine here. I guess it could be that you have
background
pictures turned off. BGCOLOR is set to FFFFFFF. I don't think that is
white,
or is it? Ican't test it as I havn't figured out how to turn background
pics
off in Netscape...

You should not save under Windows, not even in a dos-box. You have to restart the computer in DOS-mode and save from Dos. Do not ask me why, but this is the solution.
Glad that I could have an answer, instead of only questions.

Cecil Westerhoff.

They are quite common, and it's even sensible to cut them down, but it must
be done properly, i.e. between entries, and the part cut away must be at the
beginning of the line, not the end.

I was hoping that wouldn't be needed. My Win95 write tests were just to see what would happen to the Zip disk. In actuality, my main goal is to use the Zip to get edited scans from my TT to the PC (hence read-only). Even though I wasn't in DOS mode during the writes, the integrity of the data was still fine on both OSes. The directory corruption caused by Win95 does scare me, though. Instead of resorting to DOS mode during writes, I'll probably just label a Zip disk for such use and then transfer the data to a disk which Win95 hasn't written to.

Does that also hold true for the Mega STe? I was given such a unit recently (only after spending hundreds getting my 1040 ugraded to 4 megs, ICD AdSpeed, etc,)

...but the Mega also wouldn't keep time between boots. Pulled out the TL-5242/W (3.6v) and have been carrying around with me. Which replacement is easiest to obtain?

And I also could use another Beetle mouse! The Mega strill has its original `tank' rodent.

>Has anyone any bright ideas about what I can use as a finishing polish
>to get a good surface back onto the glass?

You must use some marble polishers products with a round brush put on an electric screw driver.
You must also use gradually big grain products to arrive at last with very fine grain ... prefer almost some paste products which will allow to polish without loosing too much product. But if you use polish paper don't use grain bigger than 1200 or 1600, because glass will be irremediabily unreparable.

You can also receive more information from marble & glass craftmen. But also you'll see that without any experience it can take a lot of time to obtain the adequate result.

I'm not so experienced with marble and glass polish but technically speaking it's exactly the same way we use in cabinet-making to high polish some marquetry surface.

Good luck, it's not an easy work.

4421. SOS: Problems with ATARI Megafile30

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-10 00:00:00 UTC
From: Markus Egg <Markus.Egg@vcpc.univie.ac.at>
Message-ID: <34E0B1AC.3E075692@vcpc.univie.ac.at>
Source record: 14106

Hello,

I still have one of these ATARI STF 1040(with a Megafile30 harddisk).
It worked fine for 12 (11) years now.

But just recently the harddisc behaved very "strange":
It gave some noise as if it was slowed down and I switched it off
quickly.
I opened it and cleaned the dust from the air-cooler
(there was a lot...) and the circuit boards.
Then I tried to switch it on again, but it just came to the
point, where the 2 LEDs light up and then it slowed down and
restarted again until the 2 LEDs light up etc...

All the time I heard some unusual buzzing noise from the
power supply and it somehow smelled quite awful.
Obviously the smell came from the power supply area too.

And now the funny stuff: 2 days later the harddisc was
working again - I could backup the most important bits
and pieces.

Now my questions:
1) did anyone ever have this strange effect ?
2) is it really the power supply ?
3) if 2): are there any power supplies (type: ASPF 34-4) left somewhere
out there ?
4) should I change the EMI Filter (DELTA 03DEEW3V) ?
5) are there any circuit board plans with test points so that
I could use a simple voltmeter to check a few things ?

Any hints ?

Please also cc-mail to:
Markus.Egg@vcpc.univie.ac.at

Thanks in advance
and greetings from Vienna, Austria

Source record: 14108

As I wrote in another posting: I have problems with my
ATARI Megafile 30.

It's running at the moment but who knows...

I want to do an easy backup of the harddisc without taking every single
file out of the directories and copy it to floppydisc.
Possibly with the comfort of just changing floppydiscs from
time to time.

Is there any PD software that handles backup of harddiscs ?

This isn't a directory corruption. It looks like they're part of the
VFAT file system (long filenames) used by Win95. These shouldn't make any
difference to the disc, although if you use very long names it will fill
up the root quite quickly.

If you wan't to get rid of them, you could try using a program called
OPTIMISE. It's really a HD optimiser but it has a logical check that
can be used to remove these directory entries quite painlessly. It's
archive name is HP_OPT26.LZH, although it may be a .ZIP. I'm not sure
as to where you'd find it, but someone else may be able to point you to
an FTP site with it.

These lights mean that the drive was not able to get to 'Ready' status
in the time allowed by the onboard controller.

>All the time I heard some unusual buzzing noise from the
>power supply and it somehow smelled quite awful.
>Obviously the smell came from the power supply area too.

Overloading! My guess is that the bearings on the hard drive are worn
and are introducing excessive resistance to its spinning. The drive
will take a high current while it is still trying to get up to speed.
I'm quite surprised that the PSU fuse did not blow.

>And now the funny stuff: 2 days later the harddisc was
>working again - I could backup the most important bits
>and pieces.

This IS peculiar but I have seen it happen before. You should be happy
that you have managed a back-up (some people don't get the chance :-()
but do not assume that the problem is over.

>1) did anyone ever have this strange effect ?

Yes, very recently with an old and well used Seagate 1096N.

>2) is it really the power supply ?

No, I don't think it is. BUT .... if the PSU keeps getting stressed it
may fail (fuse or something more serious).

>Any hints ?

I really think you should consider replacing the mechanism before your
troubles get worse.

Thanks for this info.
Is there any way to check the parameters of the controller
so that I find a reason for this strange behaviour ?

> >All the time I heard some unusual buzzing noise from the

That sounds like "worst case"...

> The drive
> will take a high current while it is still trying to get up to speed.
> I'm quite surprised that the PSU fuse did not blow.

Fuse is and was ok all the time (fuse was my first point of wonder too).
Is there any data about how much the drive should take as current ?
Any layout maps with measure points to place my volt/amperemeter ?
Is there a possibility that dust came into the bearings and made them
rotate slower ?

> >And now the funny stuff: 2 days later the harddisc was

It's only a backup of the most important files.
Thank you for the pointer to "easy complete backup" !

> >1) did anyone ever have this strange effect ?
>

> Yes, very recently with an old and well used Seagate 1096N.

I guess you trashed it... ? :((

> >2) is it really the power supply ?
>
> No, I don't think it is. BUT .... if the PSU keeps getting stressed it
> may fail (fuse or something more serious).

Another thing that looks odd:
I dismounted the PSU-circuit board to check the conductors etc.
There are 2 points where the board looks "burned":
It is a rather huge resistor (high power I guess)
which resides near a transformator and has physically contact with this
transformator. This transformator seems to get quite warm
in normal use - at least that's what I found out when the harddisc
luckily came up again.

> >Any hints ?
>
> I really think you should consider replacing the mechanism before your
> troubles get worse.

Are there still some harddisks for the Megafile 30 around ?

Thanks in advance

Here's an exerpt from "The TT030 Homepage", recently updated:

_____http://www.megacom.net/~q-funk/tt-home/repairs.htm_____

Realtime Clock Battery

In case you have troubles locating a suitable replacement, request a 3.6v lithium
battery for a 386 PC realtime clock; the part is compatible.
Here are some known subsitutes for late revision (single-fan) TT motherboards:

*
TADIRAN
TL-5242/W 3.6v Hi-Energy Lithium Battery (original Atari part)

*
NICA Power Battery corp.
VL111AA 3.6v Hi-Energy Lithium Battery (made in Canada)

Note that the older motherboards (with 2 fans on the back) are reported to require a 6v
battery.
Can anyone confirm this with evidences (Atari field service manual or other "reliable"
source)?

This is just a guess but...:

I remember that there are some liquid-like things to
level scratches on music CDs.
In the case of music CDs this is vital for the laser to be able
to read the information on the disc (hopefully) without
any disturbance from the scratches.
As I remember the liquid fills up the scratch.
But I do not know how this would behave on a larger scratch
and on glas.

>> Is there a possibility that dust came into the bearings and made them rotate slower ?

The bearings for the spindle shaft are of a sealed nature. Getting "DUST" in them would be rather hard to do, don't you think. A better guess is that the spindle motor itself is going bad..... I used to see this quite alot when I worked for Disk Drive Repair in Portland. You got to remember that the average spindle shaft rotation speed is about 3600 rpm or faster. How long have you had this machine? Actually you can still find used MFM or RLL hard drives that work in that system. I wouldn't pay very much for one these type of drives though. Best suggestion would be replace the drive before it totaly quiets on you.

For Sale:

Very limited quantity network Adapter cards for the following Atari
Computer Systems:

Atari Mega ST's (MegaBus version)
Atari Mega STE and Atari TT030 (VME Version)

Note: The Atari Mega STE and TT030 slot can only accomodate (1) one
device, so if you are using a graphics card and want to also use the
network card this is NOT possible in a stock system

WARNING: Many Atari Mega STe's were sold with their VME PAL chips
removed, you will need to buy a set of PAL's and install then for these
adapters to work. To check and see if you have the PAL, open your Mega
STE and look at the 2 sockets close to the VME bus slot, if they are
present you are set, if they are missing you will need to contact B&C
Computervisions (Atari Sales & Service Center) 916-295-9270 or BEST
Electronics 408-243-6950 and order a set.

These cards are compatible with Linux, BSDnet/Atari, and Atari System V
Unix which all have the drivers to use these Ethernet adapter cards for
TCP/IP communication.

I have just recently acquired TOS drivers written by Atari Germany for
these cards, most of it is in Germany, but easy enough to understand,
the drivers are called TOS ANS (Atari Network Services), if someone can
upload these drivers to UMICH or someplace public I would like to place
these drivers up onto the Internet for everyones benefit.

Both versions (MegaBus and VME) are the same price:

Riebl Ethernet Adapters: $150 each (Includes 1 3.5" disk with TOS ANS
drivers and 1
"T" connector for the Ethernet card)

Shipping within the U.S. is $5.00 USPS Priority Mail, Shipping outside
the US via ground is $8.00, via Air is $14.00

NOTE: Quantities are very limited, please contact me by email prior to
sending payment to reserve a card.

Curt

I find that Everest wraps lines longer than about 255 characters.Furthermore, it
usually drops one character at the wrap point.
(Thinking on the fly... the dropped characters may only occur when the <CR><LF>
endings are in use)

|> in the time allowed by the onboard controller.
|
|Thanks for this info.
|Is there any way to check the parameters of the controller
|so that I find a reason for this strange behaviour ?

Ermm ... I don't have the data but I don't think it would tell you
anything interesting i.e. WHY the drive was failing to become 'ready'.

|> Overloading! My guess is that the bearings on the hard drive are worn
|> and are introducing excessive resistance to its spinning.
|
|That sounds like "worst case"...

But it is to be expected on drives which have done long service.

|Is there a possibility that dust came into the bearings and made them
|rotate slower ?

Typically a drive takes 3-4 amp when coming up to speed and about 0.5
amp when it is 'ready'. Depends on the device model. What is yours?
Now, 3-4 amp will overload the PSU in most drive boxes. The desighners
assumed that this would only continue for a few seconds.

|I guess you trashed it... ? :((

:-) No, I have not managed to find a replacement yet. But I have moved
all the important stuff onto another drive.

|Another thing that looks odd:
|I dismounted the PSU-circuit board to check the conductors etc.
|There are 2 points where the board looks "burned":
|It is a rather huge resistor (high power I guess)
|which resides near a transformator and has physically contact with this
|transformator. This transformator seems to get quite warm
|in normal use - at least that's what I found out when the harddisc
|luckily came up again.

I wonder whether you have a switched-mode power supply or a normal
transformer/rectifier one? It is not unusual for PSUs to operate at
around 50C - the switched mode are usually cooler.

I don't think that the burn marks you see are very significant. There
is usually SOMETHING on a PCB which gets a bit hot!

|> I really think you should consider replacing the mechanism before your
|> troubles get worse.
|
|Are there still some harddisks for the Megafile 30 around ?

Urghhh! These are RLL devices, I think, and will be hard to find.
Those that you DO find will probably be near to the end of their
lives.

You may be lucky. I don't know much about it but many of these early
drives had 2 parts (often 2 PCBs) in their host adapters. The first
part did DMA->SCSI and the second part did SCSI->ST506. If you can
split your host adapter like this you could use a normal SCSI device.

Hmmm... but only 8+3 filenames were used -- from what I read VFAT shouldn't be a factor then. With a sector editor, a cursory inspection of the Zip disk showed what looked to be a 'normal' directory (not enough room for long filenames). Judging by the two wonky hidden files that appeared after Win95 did a write, it looks like part of the directory was overwritten and TOS interprets this additional data (whatever it is) as actual file entries. Perhaps this additional data is spillage from Win95 updating (modifying) the FATs? Whatever it is, as far as TOS is concerned, it's still some form of corruption.

>If you wan't to get rid of them, you could try using a program called

>an FTP site with it.

Yes, I do use Optimize 2.6. I repartitioned the test Zip disk that Win95 wrote to, so I can't try this out right now (I don't own a PC). Thanks for the tip -- I'll certainly try it. I can assume you've done this on an EZ-135 cartridge that Win95 wrote to?

Although initial write tests with TOS/Win95 worked fine, my previous floppy experiences with the same tell me not to trust such media for long-term use. Other than booting in DOS mode as Cecil mentioned, I think the second safest method is a temporary Zip disk specifically for Win95 writing 8+3 filenames to.

Sure, you have standard video, i.e. resolution etc. These pages have a fixed
width for instance, which is horrible for anything else but standard video.
The whole point of HTML is that the pages look well on all hardware.

> before. They are also under construction. so don't judge them to early.

They have big graphics, wasting bandwidth. IIRC they even put text into
graphics which is most stupid. They won't have done that if the final version
was meant to be different.

>> It's been the first time that I've seen somebody using white text on a
>> white background (!) It's ridiculous.
>
> Where did you find this? On your own pages? ;-)
> Seriously I couldn't find this anywhere at all. Tell me where?

All the following pages, for instance http://www.atari.de/messe.htm.
Someone said there was a background graphic, but even though I haven't
switched background graphics off, I did not get it. Still there is folx
who do switch them off, and they will definitely end up with white text
on white background, being utterly unreadable.

> BTW. Background colours looks to be something that they havn't masterd
> at all. Maybe it's a limitation in the webdesign program they use.

If so, the program should go into the bin. Still if they had to use it,
they would refrain from using color specifications at all, if they had
the faintest idea what they are doing (which they don't).

>to the rest of the OS/architecture).

Both you and David are right about the long filenames. I honestly thought it was something else, since no long filenames were used during the tests (or at least I thought that was the case).

In an attempt to understand things better, I searched the Web for info on VFAT. I found an informative article titled "Notes on The Structure Of The VFAT Filesytem" (http://www.cs.rochester.edu/users/grads/gchunt/vfat.html).

With the extended FAT system, Microsoft has inserted extra
directory entries for any files with extended names. (Any
name which legally fits within the old 8.3 encoding scheme
does not have extra entries.)

These extra directory entries are causing TOS to interpret them as separate files. Somehow I didn't adhere to the old 8.3 scheme when I saved the file. So, if I reported this in the TOS directory

Aw. -1 31Mar207 31:63:62
Aw. -1 31Mar207 31:63:62

means that two of these extra 'slots' were created during my PC session. I understand now.

The article also states that "Slots for a file always immediately proceed their corresponding 8.3 directory entry". Because of this, resaving the same file could be potentially dangerous, because it sounds like Win95 will just overwrite the next legitimate directory entry (or entries, depending on how long the filename is). I'll take that info as 'advice' and only "Save As" from Win95 to the Zip disk (i.e. not overwrite an existing file). I'll try a test, though, to see if this does trash part of the directory. But first I'd like to learn how to save out of Win95 using only 8.3 encoding <g> -- obviously I'm not doing that.

Megafile30 had the SCSI/DMA host and RLL adaptor on one circuit board.
This is not separable. Some early SH204's had separate adaptors like the
Supra's and ICD. You have to use RLL on that host. Better to get a SCSI
host and use the larger drive you have. Older Atari is SCSI 1. Falcon
supports SCSI 2. PC world is up to SCSI 3 and beyond. These new drives
will not work with an older SCSI host. Need ICD Link 2 for newer drives.

You can still find the MFM and RLL drives used. If I remember correctly the
Megafiler system could only use MFM or RLL drives. If I was going to replace
one of these systems I would get myself a LINK II and a good SCSI hard disk

I don't have it turned off either. So if there are supposed to be background
pictures, there must be some other reason I have not got them. But pictures
or no pictures, many people have background graphics turned off by default.
What should they say ?

Yes, FFFFFF is white. It means Red=FF|Green=FF|Blue=FF, i.e. all three colors
at their uppermost intensity which gives white of course.

4452. Do any PPP's support CHAP?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-12 00:00:00 UTC
From: Spencer@mettav.demon.co.R.E.M.O.V.E.T.O.R.E.P.L.Y.uk
Message-ID: <28323_Spencer@mettav.demon.co.R.E.M.O.V.E.T.O.R.E.P.L.Y.uk>
Source record: 14133

Of the crop of PPP packages available on the Atari do any of them provide
support for CHAP?

You see I've recently setup STing so that I can dial into work which is great
(apart from the fact my password changes every minute which requires some
fancy footwork on the part of the DIAL.SCR ;-) but I do not have the likes of
a two way usenet or pop mail service, plus work are increasingly blocking
undesirable sites (which doesn't only
include the obvious ones but also some Atari sites like that which hosts the
MintNet FAQ!!)

So I am toying with the idea of signing up with the ISP I was with last time
as they weren't to bad, the only problem being that they will only support
CHAP authentication and not PAP!

I couldn't find any mention of CHAP support in the STing documentation so if
its in there Peter, sorry.

So any suggestions?

Spencer

That works with almost all servers for the X Window System (and for sure
Linux is not the only operating system that supports X11) and is only
necessary for displays with <= 256 colors (i.e. those using pseudo color),
anyway.

Ciao

Thomas

~11 years.
I guess it had it's 1200*(10^6) r's ...

What about replacing the spindle motor ?
Or would this (be impossible because of)/(damage) the sealing ?

> Best suggestion would be replace the drive before it
> totaly quiets on you.

What drives can be used as alternatives (in case I find how to
split up the SCSI part) ?
I'm just checking all possible (and impossible ?) ways to keep
this thing running another 11 years.
:)

Roger Cain wrote in another posting that the
host adapter of the Megafile 30 may consist of two
parts:

"The first part did DMA->SCSI and the second
part did SCSI->ST506."

So my questions are:
1) Where can I split up the host adapter and how ?
2) Our sysad told me that there are more than one
SCSI standard.
Which SCSI standard is the one of the host adapter
in the Megafile 30 ?
SCSI 1 ?
(I'm asking because the sysad has a
Seagate ST 1480N
drive lying around 8-) that I possibly could get)

Thanks in advance

I have an STe with a hard drive.
Years ago I had a STf with a hard drive, but as far as I can
remember the hard drive only rotated when it was saving,
and stopped spinning when it had finished.
My present hard drive spins continuosly and I would prefer
it not to.
I am using ICD software/hardware.
Any ideas or is my memory of the quiet hard drive incorrect?
All hints ideas welcome.
My Email address is davyl@enterprise.net - or post to newsgroup

Thanks,
Davy Lamb

Don't believe that. Only notebooks stap their harddisks
(after it hasn't be used for some time) to save power.
Nowadays Win95 thinks at may switch the harddiskoff and
it wouldn't be windows if the implementation wasn't
flawed: it can damage the data on the drive. I had to
fix two Win95 machines with this problem.

> My present hard drive spins continuosly and I would prefer
> it not to.

Don't, let it spin, spinning up and down stresses the
hardware of the drive much more then spinning for some
hours (days?) at constant speed.

> I am using ICD software/hardware.

Using the right SCSI commands it's possible. Don't know
them by heart.

> Any ideas or is my memory of the quiet hard drive incorrect?

Your memory about a quiet harddrive is undoubtly correct,
but your assumption about starting the motor isn't. I
think you heared the movement of the heads.

I think the garbage you saw are the long filenames of Win95. It uses
system,readonly,hidden,disklabel directories to put in the long
filenames (encoded in Unicode) the long filenames. That way it's
still compatible with the old standard (great! isn't it?) and
has a very awkward method for creating long filenames (fits nicely
to the rest of the OS/architecture).

Bye, Hans

So have I.

> can it be used on a pc in any way? perhaps via the 9 pin serial port.

Yea, any Atari joystick can be used as a PC digital joystick by simply
using a converter to allow it to be plugged into the PCs joystick port.
I saw the details of such a converter on an FTP site... not sure of details,
but ISTR that it was called atarijoy.zip or simular, and may well have
been on x2ftp.oulu.fi somewhere...

For many PC games (but certainly not all), an analogue joystick is much
better...

AFAIK, this is only in the SH204 and SH205 drives. The megafiles
have all this integrated on the same controller board, so you
cannot isolate the SCSI signals from the rest (well, I suppose you could
theoretically, but it would be a helluva job finding each one).

Only the Megafile 44 (the Syquest job) had an internal SCSI.

I guess this more or less answers the following questions:

|Where can I separate DMA->SCSI and SCSI->ST506 ?
|
|There is a jumper(?) with mark "J4" on the board:
|O M K I G E C A (-> printed on board)
|: : : : : : : : (-> double row of pins)
|P N L J H F D B (-> printed on board)
|
|Does this help anything ?

Just one board? That does not sound very promising. I was hoping there
would be 2 boards with the one nearest to the ST terminating in 50
connectors. This would have been SCSI which you could have connected
straight to a modern drive.

Unless you can track down a little-used ST- (RLL) drive, Markus, I
think you had better prepare yourself to move to SCSI technology with
a new host adapter. :-(You have done quite well - there cannot be
many ST drives still working.

My schematics is in REALLY bad shape, so I think its beyond of power of
any
scanner.
Second problem is minor variations between machines- with/without RF
modulator, memory
quantity and chip type (1Mx1/256Kx1/256Kx4), TOS ROMs (2 or 6), blitter,

inbuilt floppy etc.
If one would want to be pedant to the end, it would mean many very
similar
schematics.
If drawn through Tango, same schematics could be used for development
purposes
without
the need to transfer data in electronic format, provided that one works
with
Tango for DOS,
off course, and one could embrace main thing in common schematic and add

several minor ones
that would cover variations.
I see purpose of doing it only for computer mainboards as other
periferals
(SM124
for example) have many variants which are very different internally.
Ooops, I have forgot about copyright problems, that would be a problem
too...

Regards,

Branko

Body handling: Binary attachment payload not displayed: vcard.vcf

Hi!

I'm about to buy myself an Atari Mega STe with 240 MB HD and 4 MB RAM.
The guy I'm buying it from says it has a graphics card. With this option
I can fit an PC VGA monitor on to the machine. Is this right? Will I be
able to use Music progs. (as Cubase) with it (High res. mode)?
How much should I should pay for it? (It've got a noisekiller(for the
HD-fan), a bad 124 monitor, 2 mouses, etc)

Thanks

I purchased my TT in early 1992. I understood it was a refurbised return and therefore assumed that it was an early version particularly as it had a DD 720k floppy. It has two air outlets at the back but only one fan inside. It *definitely* needs a 6 volt battery (and so far nothing has fried).

> Or would this (be impossible because of)/(damage) the sealing ?

A: Actually replacing the spindle motor requires a "clean room" as you are actually taking the whole hard disk apart. Just a simple speck of dust inside the hard disk unit can ruin it. This is not a do it yourselfer type of job. It would probably be more cost effective just to replace the drive with a used MFM or RLL drive. These can still be found (used). Better yet I would gut the Megafiler. Replace Atari's idea of a host adapter with a LINKII and get myself a good SCSI hard disk. You can get a SCSI or a SCSI II hard drive pretty cheap. They are very dependable and fast. Hope that his helps

Source record: 14055

Thanks to all who answered my questions.

At the moment it looks like as if the Megafile 30 is working
again.
I could backup the whole harddisk with "TURTLE" (thanks Roger Cain!).
There is an old Megafile 60 lying around at the machine room.
I'll probably get this from the sysad together with a Mega 2.
So I'll replace my ATARI 1040 STF with the Mega 2,
try to use the Megafile 30 and the Megafile 60 (also backed up)
together as long as possible.

If one of them fails, I'll have to buy a SCSI hard disk
(or take the Seagate ST 1480N - is this possible ?)
together with a LINK II host adapter.
(thanks to dwmoar, John Kolak,Nicholas Bales and all the others).

One question remains: Can I take the PSU from the Megafile 30
or the Megafile 60 to power e.g. the Seagate ST 1480N ?

Hi!

In article <6bvvic$6po@thoth.portal.ca>,
roughley@HORMEL.unix.dsoe.com (Neil Roughley) writes:
> Both you and David are right about the long filenames. I honestly thought
> it was something else, since no long filenames were used during the tests
> (or at least I thought that was the case).

Well, not only /long/ filenames cause this behaviour, but also filenames
that contain lower case characters. I.e. if you save a file "SHORT.TXT",
no VFAT slot will be used, but "short.txt" will, as the real name contains
lower case characters. At least, this is what the first release of Win95
does, it may have changed in 95a or 95b.

You can check the behaviour of the Win95 you're using by using a DOS
shell. Just type "dir" and it will show any VFAT names at the end of each
listed directory entry. In the above case, it would look like "SHORT.TXT
<some attributes> short.txt".

> In an attempt to understand things better, I searched the Web for info on
> VFAT. I found an informative article titled "Notes on The Structure Of The
> VFAT Filesytem" (http://www.cs.rochester.edu/users/grads/gchunt/vfat.html).

Thank goodness :) Now I don't have do what I was about to do today ...

> The article also states that "Slots for a file always immediately proceed
> their corresponding 8.3 directory entry". Because of this, resaving the
> same file could be potentially dangerous, because it sounds like Win95 will
> just overwrite the next legitimate directory entry (or entries, depending
> on how long the filename is).

That's not a problem at all. If the filename stays the same length,
nothing will change at all. If it gets shorter, so that less VFAT entries
are necessary, the first old slot will be marked as a deleted file (i.e.
as a free slot), so that it can be used again for one single 8+3-filename.
If the filename gets longer, so that more VFAT entries have to be used,
all slots including the corresponding 8+3-entry are marked as deleted
files and a new position within the directory is used which fits all slots
(it may of course be the same, depending on how many free slots followed
the 8+3 entry).

Note that the VFAT concept therefore introduces directory fragmentation,
as it may now happen that new filenames requiring more than one slot don't
fit to the first free slot of the directory. An example:

Assume you have a file A named "morethan8", which needs one 8+3 and one
VFAT slot. Assuming it is the first file put to the directory, it will

have these slots in it (not mentioning the obligatory slots used for "."
and ".." in sub directories):

"morethan8" - VFAT entry for "morethan8"
"MORETH~1" - 8+3 entry for "morethan8"

Now A is being renamed to "LESSTHAN.8" which perfectly fits into one 8+3
slot. The VFAT slot will therefore be marked as empty:

"" - Empty slot, may be used again (actually, the name starts
with the special character 0xe5)
"LESSTHAN.8" - 8+3 entry for "LESSTHAN.8"

After that, a second file named "againmorethan8" is created, which will
need 3 slots, one for the 8+3 name, and two for the VFAT name (one VFAT
slot only covers 13 characters). Now the directory will look like this:

"" - Still an empty slot
"LESSTHAN.8" - 8+3 entry for "LESSTHAN.8"
"8" - 2nd VFAT entry for "againmorethan8"
"againmorethan" - 1st VFAT entry for "againmorethan8"
"AGAINM~1" - 8+3 entry for "againmorethan8"

You see, the empty slot has not been used again, and the situation gets
even worse the more rename and/or file delete operations are used in a
directory. Therefore, it can easily happen that a directory grows (i.e.
needs a new cluster) even though the total number of free slots would be
enough to store the new VFAT name. That's the price to pay for backwards
compatibility.

Of course, a VFAT fs driver could do on-the-fly garbage collection when
changing anything in a directory, but this would slow down directory
access even more (it's already slow enough on FAT filesystems) and would
also mean a high risk because the complete directory could get trashed in
case of an error.

Mhmm, it seems I've written too much again ...

Ciao

Thomas

d > I need to know the way to create a custom printer driver for
d > use on PageStream 2.2. I have a HP540 deskjet.

Some time ago SoftLogik released the source code for several of
their printer drivers. I have written several additional drivers
(including HP Deskjet 600 and 800 series), which can be downloaded
from teleport.com/~atari (or something like that).

I don't have docs for the 500 series, though. Or the Laserjet 5
(which I use), as HP now provides their own printer drivers (for PCs
and MACs only, of course) and won't release their docs.

THE ATARI ST QUICK FAQ - v2.3 / 1998-01-29

The 'Quick' FAQ was initially intended to be a small list of resources made to avoid comp.sys.atari.st newcomers asking the same questions over and over again. However, as the project progressed, and other members of the Atari community became involved, it simply became bigger and bigger. I doubt it really deserves to be called 'quick' any more, but hopefully it will still serve it's original purpose.

Here is where you can find it:

HTML/WEB - FRANCE http://wwwperso.hol.fr/~nbales/quickfaq.htm
HTML/WEB - USA http://www.geocities.com/MotorCity/2090/quickfaq.htm

TEXT/FTP - NORWAY ftp://ftp.sol.no/user/hallvart/atari/info/quickfaq.txt

ZIPFILE - USA http://www.geocities.com/MotorCity/2090/quickfaq.zip

If you cannot access any of these, but wish to receive a copy of the FAQ through e-mail, send a message to the following autoresponding address:

AUTORESPONDER bales@garonne.stortek.com
Note: The subject line must be: ATARI FAQ REQUEST

Cheers,

Nick.

Unfortunately, Win95 tries to be clever sometimes and fiddles around with
filenames - in Explorer, if you create a directory in all upper-case, it
assumes you had caps-lock on un-intentionally, and so changes it to a
capitalised
directory name. Very helpful, not. (I have 95b).

> You can check the behaviour of the Win95 you're using by using a DOS

> <some attributes> short.txt".

Yea, and if you use RENAME, or COPY in a DOS shell you can be certain that
it will do what you ask it to.

|(or take the Seagate ST 1480N - is this possible ?)

Yes, grab it while you can!

|together with a LINK II host adapter.

.. or you may find someone offers you a different second-hand host adapter. They will all work with this Seagate (ICD, Supra, GE-SOFT). If you are REALLY lucky someone might offer you an old 'shoe-box' (ICD, Supra Gasteiner). The HD and PSU may be broken but the h/a will be OK.

|One question remains: Can I take the PSU from the Megafile 30
|or the Megafile 60 to power e.g. the Seagate ST 1480N ?

Yes. Hd's require +5v and +12v. Old models run at about 25 watts, more modern ones at about 12 watts. The PSU in the Megafile is rated at around 50 watts, I think.

4478. Mega STE AppleTalk port <-> Ethernet ???

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-13 00:00:00 UTC
From: Conan Ford <cokford@acs.ucalgary.ca>
Message-ID: <6c2jsb$bl0@ds2.acs.ucalgary.ca>
Source record: 14063

I have a old Mega STE 4 with the built in Appletalk port (or whatever its called).
I also have two Windows 95 PC's with 10-BaseT ethernet cards. Because of the
large storage space on the PC's, I'd like to be able to access their files from the
Mega STE over the ethernet. I currently have the PC's in a peer-to-peer network,
sharing printers and files, and using NetBEUI, and IPX/SPX.

Is there an easy way to connect the Mega STE to the PC's?

Thanks

Conan Ford

in order of cubase audio 2.0 manual I had do in my atari falcon 030 the
following
suggested modifies for decrease the input audio internal port gain:
I had removed R56; R57; R90; R92; C21; C81;
I had changed R66 and R87 from 100K to 47K
I had put 470 pF in parallel to R67 and R88
I had put 100 pF in parallel to R66 and R87

The audio sensibility of my falcon is now orrible not better of the
original state.

So, I'm looking for the original values, for re-replace it, of the
follow components:

R56 =?
R57 =?
R90 =?
R92 =?
C21 =?
C81 =?

THANK YOU!!!

Yes.

Will I be
> able to use Music progs. (as Cubase) with it (High res. mode)?

Most modern well-behaved programs are compatible with high end graphics
cards, but some aren't. I've seen some mono only programs insist on mono
even when running in hi rez color.

> How much should I should pay for it?

MegaSTE's seem to be going between $200 to $500.

Mega STE has Localtalk, which I believe is Appletalk compatible. Don't know if PC's can talk Appletalk. Might be easier to get an Ethernet card. Maybe one of the programmers that visit this group could give a better answer.

It's not my task to judge the price, but I think it should be mentioned that
Best Electronics sold those for $60 each at the last Atari fair in Neuss.

> its in there Peter, sorry.

STinG does not support CHAP at the moment, only PAP. I do not think
PPP-Connect does support CHAP either. Maybe MiNTnet does, I don't know.
Since most MiNTnet applications are straight ports of the Unix versions,
this has some likelyhood.

CHAP is considerably more complex and complicated than PAP, and *very*
few people require it.

You can't. They are merged on the same PCB.

> 2) Our sysad told me that there are more than one
> SCSI standard.

Not really. There are upgrades, which are all compatible. The only
hardware incompatibility is wide SCSI with 16 bit data bus.

> Which SCSI standard is the one of the host adapter
> in the Megafile 30 ?

None. The Magafiles do not do SCSI, but ACSI. In terms of SCSI, the
ACSI is incomplete.

> SCSI 1 ?
> (I'm asking because the sysad has a
> Seagate ST 1480N
> drive lying around 8-) that I possibly could get )

If it's not a wide SCSI drive it's likely that it'd work with Atari
machines. However, you need am SCSI hostadapter, unless you use a TT
or a Falcon. The Mega STE has an SCSI hostadapter built in.

I just had a look myself at the homepage and messe.htm. Out of
curiosity I wondered if the package they'd used had done the same
thing microsoft publisher did to most of my site - it has a habit of
merging text and graphics into one huge image for no apparent reason.
Actually, there is a reason: if two things overlap they get converted
into an image. This new image in turn may then overlap something else
and so on. Trouble is, it's idea of what overlaps and our idea of what
overlaps just ain't the same. It has a good paper-plane making wizard
though ;-) I digress!

It turns out they were done with Netscape Communicator 4.01. This is
one of the "better" editors. After a quick check I discover it is nigh
on impossible *not* to notice this problem, and it is easily fixed.

If someone wants to email them, tell them this ...

Right click on the background image - then "Page Properties-> Page
Colors-> Use custom colors-> Background" and change the bugger from
white to black.

This will ensure if the background image is not loaded the white text
will still be visible. Some redesign is still needed however because
16 colour browsing with that background image enabled is a 'no-no'.

If you want to embarrass them then tell them it's next to the option
for specifying the background image (where it sez words to the effect
of "if background image isn't displayed this will be the background
colour")!! ;-)

The background graphic is a very very dark, with very dark blue
patches on it. It's about 10K but I've cropped it to 1K here.

It also serves as a test for me to see if i've figured out my reader's
"attachments" correctly for these groups. ;-)

Incidentally, backgr.gif (its original name) took an age to download.
Cab may have given up on it?

MiNTNET (or to be more precise, pppd) supports CHAP. Atleast according
to the docs, I have never tried it myself.

> capitalised directory name. Very helpful, not. (I have 95b).

As far as I remember, it's only that the Explorer /displays/ filenames
with all letters uppercase the way you describe it - on disk, they are
still all uppercase. But as I'm currently running Linux on my PC to post
this message, I can't switch to Win95 to double check that ...

> I like the sound of this. Good luck. :)

?

Ciao

Thomas

4494. Re: SOS: Problems with ATARI Megafile30

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-14 00:00:00 UTC
From: "Mr. G." <ggg@idirect.com>
Message-ID: <34E604FC.EF5EB22B@idirect.com>
Source record: 14079

I had a similar experience with my Megafile 60. Actually, it had problems
for a long time (years) with the platters sticking on bootup.

It finally almost went up in flames one day and took the power supply
with it.

Anyway, I decided to make the best of a bad situation and bought the
Link II and a Quantum Trailblazer 850. It turned out that that was almost
as big a boost as when I got the 60 in the first place. I never missed
that old megafile at all. It was great to be rid of the jetfighter roar of

that cheap fan too.

So, maybe its the start of a GOOD thing!

:) Backups are great!

From: Jim MacQueen <macqueen@mnsi.net>
Message-ID: <6c4uu3$p6d@backup.mnsi.net>
Source record: 14080

I'm trying to get this ol' Mega2-ST runnin' on the Web for my son! It calls in, logs in, gets the IP and gives me the "Success" message. I then go to CAB and the MNSi Homepage is listed as HOME, but nothing comes up on the screen!!!! I've tried sending it to other sites, but still the same thing. I'm connected, but nothing shows....there's also no traffic on the modem SD/RD idiot lights at this point! I'm sure it's something with CAB (but I could be wrong). I've tried to change the settings, no graphics, mono, colour, etc. !
Anybody got any ideas????
System spec.'s: Mega2-ST 2Mb
TOS 1.2
60 Meg HD (15M free on
cache partition)
Both Colour & Mono Monitors
USR 14.4 Modem

Thanks,

Jim

4496. Atari Hard Drive

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-14 00:00:00 UTC
From: James Reyna <jreyna@ghg.net>
Message-ID: <34e61c31.0@news.ghgcorp.com>
Source record: 14081

I recently acquired an Atari SH204 and I went and found the AHDI program and HDX and all those utilities... the original MFM hard drive seemed to not retain data and write erroneous directories and files with just the first letter of the file and the extension intact. I thought that maybe the hard drive was bad, so I replaced the original drive with a Seagate MFM. It seemed to be working fine, except it started doing the same thing... could the SCSI controller be bad or is it possible that there are some jumpers or something that I might need to adjust? I didn't move the jumpers on the Seagate MFM... do I need to? Has anyone ever seen this problem before? Are Atari hard drives just flaky? Please direct all replies through email. Thanks.

I'm not the first to complain about a failing atari harddrive, but I'd really like to get mine working correct! Ok, so here's the problem:

I got a SH205 from a friend a week ago, together with a MegaST 4. Er, that's not the problem yet :-) Here it is: when I connect the harddrive to the MegaST and boot (it has a built in delay-circuit I believe) the system still tries to boot d boot from the floppydrive. But: that doesn't work, and when the desktop finally arrives, I can't read disks correctly until I disconnect the SH205!!!

But when I connect the harddrive to my 1024ST, it works just fine, flawless I'd say!

help me out please!

Sandor

Atari hard drives are usually rock solid. You could have a bad
controller card. You might check to see that all cable connections are
clean and secure. Also check that the DMA cable to the computer is not
severely bent. This is a fussy cable and a cause of many HD problems.
Sometimes straigtening it out works, others you have to buy a new one.

Are you sure the computer is connected to the right port on the drive?
If you cannot access the floppy, that means the HD is tying up the DMA
chip.

Ah, you come from the country where fuses are in the mains leads... ;-)

I'm not sure it would be very beneficial for a company to be making such
things. A PC analog joystick or a joypad is worth UKP10, so there wouldn't
be much point in charging UKP5 for an adapter to old digital joysticks.

It sounds like a pretty simple piece of hardware. Maybe you could find
someone near you who could make it for you. Probably a 10 minute job if you
have soldering iron.

Cheers,
Nick

4503. SIMM upgrade on STFM

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-15 00:00:00 UTC
From: Alan Hourihane <alanh@fairlite.demon.co.uk>
Message-ID: <887585747.20777.0.nnrp-07.9e9834fc@news.demon.co.uk>
Source record: 13999
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I have a 520STFM upgraded to a 1040STFM with DRAM chips and
decoupling capacitors.

I've read that someone had posted a 4MB 72pin SIMM upgrade
for these ST's.

Well, I've done it and it sorta works. I've run CheckST which recognises
4096k of memory. Good.

But, I've connected the /RAS and /CAS lines to +5v with a 10k resistor
(tried a 4.7k one too), but I'm getting static on the screen which is
obviously bit errors in memory, and it's flickering. Some programs are
causing illegal instruction errors which worked before (i.e. 4 bombs).

I'm wondering if the decoupling capacitors left on the old memory could
cause this problem. I've also reduced all the cable lengths from the SIMM
to the shifter/mmu to about 3 inches. I've connected all 3 of the +5v and
GND
lines on the SIMM which seem to reduce the static when all three are
connected,
and gets worse if I disconnect one of them.

Any one got any ideas at all ?

Thanks.

Alan.

You need a ACSI to SCSI adapter. This could be an ICD Link II or one of the ADSCSI cards. The difference is the Link is a self contained unit, but can only handle up to three drives. The ADSCSI card would be mounted in your hard drive case and you have to supply power to it, and it can handle up to 6 drives. You would also need the appropriate cabling.

Okami does that - IIRC, there were versions of INN that would not pass on
articles with too long references lines (somewhere above 1000 characters),
so it is a good idea to cut them anyway.

Um - no. The headers are not part of the text that is passed to the editor,
so the editor can't mess with them.

```
The problem was the new send message dialog with scrollable edit fields -
which were limited to 255 characters, together with the fact that the
References were made editable quite some time ago.

Hello people,

I've been using my trusty old Atari ST for about 8 years now, and the other day it finally blew up. I was running Quartet when it just ceased to work -- like the power had been cut off.

I'm pretty sure it's the power supply that's dead, but I have no idea where I can get another one here in the UK.

This *would* happen just as I was going to start making serious MIDI music stuff with it. I use my 3DFX P200 for games :) and everything else...

I hope someone can help.

Please reply to me directly, as well as the newsgroup.

Thanks,

Douglas Cowan

No, I don't own a PC either, so Win95 never gets near my EZ-135. The only time it sees any of my equipment is when I transfer files too-and-fro via floppies.

My main experience of this, WRT a hard drive, comes from the VFAT system used by Magic 5. Since this is compatible with the Win95 VFAT system, the info given should also apply to Magic as well.

I've not yet had any problems with Win95 and floppies, but having a Zip disc just for use as a transfer disc could be a good idea. At least that way if there is a corruption caused by Win95, you don't loose everything, just what was on that disc at the time.

> encoding <g> -- obviously I'm not doing that.

If Win95 is sensible (don't laugh, it may be) when it creates a directory
entry for a LFN, it should look for a gap in the directory that can store
both the LFN and the 8+3 entries. I've not been able to check this as yet,
but the Magic VFAT system does. In fact it can be annoying when you rename
something because it quite often moves position in the directory.

As for saving a file with the same name as an existing one, there should be
no problems since the directory entry/entries used by it will/should be used
for the new file.

>day it finally blew up. I was running Quartet when it just ceased to work
>-- like the power had been cut off.

This has happened to most of us, I believe, more than once. However, I tried building a power supply cable that would use the PC motherboard connectors, and it works. Someone had posted the plans for doing this, which is what I used. Unfortunately, I can't find the plans at the moment, but will be looking around a bit. It's quite easy to make them, as these connectors are easily found at most computer stores.

First of all, check the fuse. That can be one thing that blows before the rest of the circuitry, and they're mighty cheap. So's a power supply from one of those cases, whether it be a desktop size or bigger. A 165 watt supply will do as well as a 250+ watt supply, with the added bonus of also being able to run your hard drives if you have any.

I've got a 165 watt supply that's been left on for 7 years, with a few times of being turned off for maintenance and that kind of thing.

There was someone who was going to post the schematics for the power supplies that the STs use, but I've not seen that yet. It would be nice to have that kind of thing lying around.

4515. Big-DOS

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-15 00:00:00 UTC
From: roughley@HORMEL.unix.dsoe.com
Message-ID: <6c6jvj$fh4@thoth.portal.ca>
Source record: 14092

To gain access to a DOS Zip disk, I've just tried Big-DOS (v8) for the first time. Besides a few initial auto folder conflicts, I was able to read and write to the DOS media right away. (Big-DOS, of course, isn't required if the Zip disk was partitioned using HDDriver's TOS/DOS scheme.)

I've read Big-DOS's somewhat technical documentation but would like to know if there's anything, in layman's terms, that I should be warned about beforehand? Although it worked fine, I was somewhat 'uncomfortable' with it being resident: when first accessing a specific partition on my hard-drive, a prompt comes up asking this:

BigDOS: FAT start of G: shall be $F8, $FF, $FF [$FF]! Write? [YN]

When any of the other partitions are first accessed, this prompt doesn't appear. The docs mention this but I'm uncertain whether to say 'yes' as described below:

There are several Programs that initialize the filesystem
not correct. By the first access or after a media change,
an error message is printed on the screen. If you type J or
Y for yes the correct value will be written on disk.
Contact the responsible programmer and tell him about the
bug. (Now you can switch off this check with Setter.)

The write prompt comes up with or without Geneva/NeoDesk on TOS 3.06 running under HDDriver 7.12, and always on the same 'G' partition. I know how to use Setter, but before I change the switch I'd like to know what to expect afterwards? And can I run Big-DOS for everyday use, or only if access to DOS media is required?

For backing up to floppies, I use TURTLE. It will easily work with a
megafile 30 and it is very fast. If you have two floppies it will take
advantage. Also it accounts for the 40 folder bug in early tos very nicely.
I use this program often. It has Gem interface.
ftp://atari.archive.umich.edu , I may have atari and archive backwards:-).

It did! The MegaST came with a disk labeled 'ICD Advantage ST' in the drive.
But the problem is that the MegaST just doesn't want to boot any disk when
the harddrive is attached, so I can't use the disk unless I disconnect my
SH205. When I disconnect the drive and boot with the ICD disk, it complains
about a missing interface (the ICD link I guess). So I figured they forgot
to give me the interface and that the SH205 was modified inside, to be
connected to a SCSI interface and no ACSI (or whatever the Atari harddrive
port is called). But when I opened the case, everything appeared to be
original and unmodified (except for a fan-regulator).

Now I wouldn't be very surprised about all this if it weren't the case that
the SH205 works fine with my 1040! ... strange...

Have you opened the Mega and checked if there's a SCSI-interface
connected to the internal ACSI-port? The SH205 won't work at all
(actually it will prevent any other DMA-device to work) if connected
to a computer with other devices on the ACSI-bus.

Everything inside seems to be pretty original, but maybe you're right. But still that wouldn't explain why the drive works fine when connected to my 1040!!! It's obvious that any other DMA-devices are blocked out (floppy)... but it seems to be more of a problem with the MegaST than the harddrive.

4522. Re: SIMM upgrade on STFM

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-16 00:00:00 UTC
From: Branko Badrljica <brankob@svet-el.si>
Message-ID: <34E790EA.E6774C2@svet-el.si>
Source record: 14007
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Use several GND wires from each GND terminal on the SIMM to near neighborhood

of the SIMM. I ussually connect SIMMs GND to nearest GND, to GND of MMU's blocking
cap, etc, and same goes for Vcc. Do not be afraid of overdoing it here, because it needs solid
GND. This is essential
since GND plays two roles; its one of power supply lines and it is voltage reference point
for all other signals. Since SIMM's power consumption varies greatly and very fast, inductance
on power lines (especially GND) can play nasty tricks on you.
If that does not cure problems completely, you can try series resistors in all active RAS and CAS
lines and all address lines (A0-A9), if they are not already on the PCB very near MMU. In that case
just pick up the signals after they propagate through resistors. Usually there are 33 Ohm res. on address
lines an address lines, 68 Ohm on CAS lines and 68 Ohms or nothing on RAS lines (depending on PCB rev.)
Rams do not like transitions on that lines that are too fast (usually they must be between 1 and
10 ns), otherwise they can overlook it... Oh yes, resistor value should be around 68 ohms.
If ther is resistor in the board already, don't add another, as it is unlikely that it would help.
Try instead shorting resistors in RAS or CAS or both lines. I have noticed that some drams do not like
them when talking with ST's MMU. You can experiment with RAS & CAS lines but surely leave resistors
in address lines...

I don't understand why would you need pullups for RAS & CAS.. If you are reffering to signals
of old drams then resistor value is not so important. It can be 10K, 1K, 100 Ohms or 0 Ohms.
I know that direct tying it to Vcc is not preferred, but works every time without problem.
What is important is that you cut RAS & CAS traces between MMU and old RAMs, so that
old cas/ras do not influence new.
If you haven't done it before, add small tantal cap. (let's say 10 microF/10V) on GND/VCC
on the SIMM's terminals or in the nearest vicinity. Decoupling capacitors are

other thing that
you can't overdo as they take role of power reservoar at current peak until
inductant nature
of power supply lines calms down.
One other thing. Dram can't be 100% tested, especially not with ST's crappy
RAM diagnostic
software, so don't rely too much on it when it tells you that all is O.K.

Hope this helps,

Branko

Maybe it's nothing, but on some ST's I have noticed that their DMA chip
has Vcc pin for power supply (pin 40-the last one if memory serves me
right) bent horisontaly and connected to Vcc through small diode like
1N4148. I could not figure the reason, but it was obvious that they
were forced to do it in the last moment, otherwise they would not go through
that complication. I switched chips between machines with and without the diode
and they appear identical, so reason probably lies outside computer.
Only reason that I can see is to prevent protection diodes on the signal lines
of the DMA chip that go to the DMA port from conducting excess currents when
disk
is on, but computer is not, but maybe there were also other reasons...

Is it possible that this also makes a difference between your two machines ?

Ok, here's a theory. I don't know what it's worth as I've never had any of the devices above, but...

Maybe TOS 1.2 (the one in the Mega) does not autoboot hard drives, whereas you're 1040 might have TOS 1.4 which does. Not sure about this, but it would explain why the two machines behave differently.

Ok, so for a non autobootable HD, you need to floppy-load a driver (if it autoboots, the 1040ST will not care about the floppy). The ICD driver is made for ICD host adapter only I beleive, that's why it complains about not seeing one.

Maybe, for a start, you could try AHDI, which is Atari's HD driver. You need to put it in the auto folder of your boot floppy. You can find some version of AHDI on most FTP sites.

Cheers,

Nick.

Yes it does :-) If there really is an internal SCSI-adapter in the
Mega, then *no* DMA-devices will work if you connect a 205! This is
due to a "feature" in the 205 and not the Mega. So if your 1040
doesn't have any other ACSI-devices than the 205 connected everything
works fine.

> but it seems to be more of a problem with the MegaST than the harddrive.

You should try another drive on the Mega if you can.

1.02 is perfectly capable of autobooting harddrives.

> autoboots, the 1040ST will not care about the floppy). The ICD driver is made

ICD Pro drivers works with (almost) all harddisks, so check if you
have the ordinary version (works only with ICD interfaces) or Pro. If
you have Pro then try booting the Mega with the ICD-disk and with the
205 disconnected. This might tell you if there are a internal
SCSI-interface in the Mega.

Three drives?? Why? Sounds odd, are you sure about this?

> hard drive case and you have to supply power to it, and it can handle up to
> 6 drives. You would also need the appropriate cabling.

That sounds interesting.

I probably get a Mega 2 ATARI.
Does this machine already have a SCSI hostadapter built in ?

If yes: where ?

My 1040 has TOS 1.0 but I could only use the harddisk with a TOS 1.4 loaded from disk, my Mega has TOS 1.4 too (I think). Currently I have a little trouble using my atari's, because I blew up my SM124, so now I have to go downstairs to connect them to my TV - which only gives a picture about 45 minutes after I turned it on !!! :-(But I'll check what it says regarding the SCSI interface it finds. I remeber it saying something about an adaptec interface on device 6 or something.

Nope, but ICD sells a small SCSI adapter that fits inside the Mega on the
MegaBus slot. They seem to still have a few of them for sale.

The ICD SCSI-adapter is connected to the internal ACSI-port, not the
Megabus. If you're keen on a internal SCSI-solution but can't get hold
of the ICD adapter you could always hack a Link 97 or similar.

Hi,
I have a Mega STe with old Seagate ST157N hard drive. HD is SCSI
drive, but AHDI driver is saying (e.g. during boot) that it is ACSI unit
0. Now question:
Is my internal host adapter true SCSI host adapter (i.e. I can connect
to it up to 7 SCSI devices), or is it only simple "translator" from ACSI
signals to SCSI signals and vice versa (i.e. I need another host adapter
to connect 2nd HD to my Atari)?

Palo Michalec

4535. Re: Graphics card for Mega STe

Hi,

>The guy I'm buying it from says it has a graphics card. With this option
>I can fit an PC VGA monitor on to the machine. Is this right? Will I be
>able to use Music progs. (as Cubase) with it (High res. mode)?

Yes, there are graphics cards that fit into the VME bus of the MegaSTE.
This is a very valuable addition to a MegaSTE. I run routinely a Nova card
in my MegaSTE, with 1024x768 in 256 colors on a 17" multisync.
However, not all programs are graphics cards compatible. Generally speaking,
you need to have also a regular SM124 mono monitor hooked to the computer.
It will be very useful to follow the boot procedure, to interact with any
boot manager, and to run software not compatible with the graphics card.

For Cubase, I don't know for sure, but probably it is not compatible.

Hope this helps.

Hi folks,

1. is there some information on www how to repair a
Megafile disk? If not, is the a book with some help?

2. I have heard about a possibility of using a 16 MHz
CPU for Mega ST - there are some cards and a kit to do this.
Does someone knows where to buy/obtain such cards?

Thanks and advance,
Artur

(...recently I was given a gift - 30 MB Megafile harddisk.
Unfortunately, after few hours the disk refused to work.
An examination showed that when connecting the 5V/12V
power supply cables from the mainboard, the 5V goes down
to 0.5V... I guess the power supply is out of order.)

Thanks Branko,

It was exactly this, I've now connected my GND lines to three different
places, one
to one of the ROM chips, a second to the LS244 and a third to the MMU and
I've
connected the +5v to another three places and this cured it. I'd never have
believed it.

Thanks again.

Alan.

PS. Can't wait for your accelerator board/IDE controller - in anticipation.

All depends on what's wrong. If the drive mechanism is dead, you can replace
it with a "new old" RLL drive, which will probably be a bit difficult to
find. It would probably be better to consider upgrading to a SCSI drive. If
it's the PSU, then you can replace the PSU with one from an old Atari ST.

>2. I have heard about a possibility of using a 16 MHz

Yes, I got this info straight from Tom Harker at ICD. The Link II only uses a 28 milliamp signal, not enough to drive more than three devices. Actually Tom said I was lucky to get three working.

Ask BEST ELECTRONICS for the relacement pwr supply. Shouldn't be too dear.

The most reliable upgrade for a Mega ST is the ICD AdSpeed 16mHz board from Tom Harker's outfit in Illinois. They are really hard to find now, but maybe someone has one to sell you. Make sure you get all the software with it for the caching, etc.

Also get a Beetle Mouse (or a Golden Image mouse if you can find one) and combine it with Atari's freeware MACCEL.PRG. The whole computer feels faster with those 2 installed together.

There are other options as well: the PaK30 board is nice but expensive, still current and supported AFAIK: from ASH in Germany. Fly at 40 mHz on that one, add MagiC and go even faster.

The jury is still out on PaK30 compatibility with CUBASE and NOTATOR, if you want to use MIDI with your Mega.

Enough already.

JG

Now I am a bit confused:
I opened the Mega 2 ATARI to see if I have to clean the fan from dust
and there was a 2*32(?) pin plug in on the board and some removeable
plastic shield at the back.
Are these pre-installations for SCSI hostadapter ?
Is the 2*32 pin plug in the Megabus ?

Sorry for my total ATARI-hardware ignorance...

The MegaSTE internal SCSI adaptor is a "simplified" one.
The "simplifications" I am aware of are:
- no handling of parity,
- recognizes only SCSI device 0,
- weak SCSI port line drivers.

So, the consequence is that you can only connect ONE drive (configured as device 0)
to the adapter, and only if the drive can be configured to ignore parity.

In your case, you must use another adapter.
I can recommend the LINK96 (WB Systemtechnik, Germany), specifically made to be
hooked internally into the MegaSTE (simple replacement of the original adapter).
Together with HDDriver, it is a perfect setup. I am using it in my MegaSTE with
an internal 1GB and an external Syquest, ans it is beautiful.

Hope this helps.

Cheers.

Roland

Hmmmmm,

That is really strange. Currently I am running two conner
hard drives/ a zip drive/ CD rom drive/ and a SCSI scanner. Wow maybe we
shouldn't tell my LinkII it can't do this. Has anyone else had problem
connecting more that three devices up to their LinkII adaptor.

Bud Connolly wrote:

> Yes, I got this info straight from Tom Harker at ICD. The Link II only
uses a 28 milliamp signal, not enough to drive more than three devices.
Actually Tom said I was lucky to get three working.

I'll make an educated guess here. Fat entries commence with entry 2 which naturally leaves entry 0 and 1 unused. It looks like this is what bigdos is displaying. Entry 0 is used as a media descriptor but mostly ignored by the atari. I can't remember what entry 1 is for. Thus you'd have to check with your hd driver if it is okay to change them. In all likelyhood the atari driver won't care at all and the sole reason for doing it will be to stop compatibility problems with a PC which in all likelyhood will refuse to read the media or make some daft assumption (like it is an 8" floppy disk).

>The write prompt comes up with or without Geneva/NeoDesk on TOS 3.06

>access to DOS media is required?

If you're handy with a sector editor have a look what values the first two cluster entries are for the other partitions. They are probably

already $f8ff $ffff which is exactly what all my partitions have. If so, I would personally have no worries about changing them but would first write down the current values in G: just in case there was a problem and they needed to be restored. Remember there are two fats and both will be changed!

Hi Jim'
just read about your problem in comp.sys.atari. Have the same setup running
properly. Sounds like CAB doesn`t load CAB.OVL. Actually it should say
something in "about CAB" if the internet routines are loaded.
If you need to get CAB.OVL look at http://www.flinny.demon.co.uk/ or
http://www.stud.uni-hannover.de/~perot
which is the STING authors homepage.
sincerely
Reiner

zd>
>>> I got a SH205 from a friend a week ago, together with a MegaST 4. Er,

>>> the desktop finally arrives, I can't read disks correctly until I
zd> disconnect
>>> the SH205!!!

>> The only thing I can suggest is that that drive comes with a boot
>> disk. Try putting that into the MegaST. Then the Mega should boot that

zd> It did! The MegaST came with a disk labeled 'ICD Advantage ST' in the
zd> drive. But the problem is that the MegaST just doesn't want to boot

I think that the problem you have is that the ICD driver disk won't work with
the SH205. Take that out and replace it with either the disk that you boot
from on your other ST OR a blank formatted disk. If the SH205 has been
properly configured then it should boot without further ado.

ICD software (unless you have the pro version) is only for use with ICD's
host adaptor and is a red herring in your case.

zd> Now I wouldn't be very surprised about all this if it weren't the case
zd> that the SH205 works fine with my 1040! ... strange...
Possibly because you aren't trying to load a hard disk driver from floppy on
that machine.

Hope this helps you...

Speak to 'ya later!

>
> Hi,
> I have a Mega STe with old Seagate ST157N hard drive. HD is SCSI
> drive, but AHDI driver is saying (e.g. during boot) that it is ACSI unit 0

This is normal. Most drivers only say "SCSI" if a drive is connected to
a real SCSI bus like the one of a TT or Falcon. Drives connected to the
ST's DMA bus are normally referred to as "ACSI" although these are often
SCSI drives. So the bus name is reported by most drivers, not the drive
type.

> Now question:
> Is my internal host adapter true SCSI host adapter (i.e. I can connect
> to it up to 7 SCSI devices), or is it only simple "translator" from ACSI

The adapter coming with the STE only supports one SCSI hard disk drive.
If you want to connect additional drive you need an additional adapter
like the LINK97. This one can handle up to 7 devices like the standard
SCSI bus can.

The hard disk driver doesn't care for the FAT contents. It's GEMDOS that handles any FAT access. Hard disk drivers never look at the FAT because these drivers work on the BIOS level. The FAT is a GEMDOS data struture.

> sole reason for doing it will be to stop compatibility problems with a
> PC which in all likelyhood will refuse to read the media or make some

Yes, this is correct.

> two cluster entries are for the other partitions. They are probably
> already $f8ff $ffff which is exactly what all my partitions have. If

The contents of these bytes depend on the software that was used for partitioning the drive. Modern software should always set these bytes correctly and if no other software changes them they will stay this way.

Both, really :-) The Link consumes power from the TERMPWR SCSI line
(pin 26) but it also 'drives' the signal lines on the SCSI bus.

I took a look at the FAT entries Guy mentioned. Six of my hard-drive's eight partitions start with $f8ff $ffff; the other two start with $0000 $0000.

The drive was recently partitioned with HDDriver 7.12. Why two partitions ended up with those FAT values is beyond me. The drive was previously partitioned with ICD Pro. I 'split' the drive (i.e. number of partitions and their sizes) to exactly what I was using before with ICD.

No matter, though, as I now know to say 'yes' to Big-DOS's overwrite prompt for those two partitions.

Why is that strange? I have 7 devices linked together and they (including my ICD link II) all behaved perfectly. (Fujitsu/seagate/toshiba CDROM/Philips CDR/IOMEGA ZIP/IOMEGA JAZ/Connor TAPESTREAMER)

I've tried to connect 8 but that was not the most bright Idea 'cos SCSI Tools uses one itself (link/software/68k). I'm running this on a MEGA STE.

Wow, you're right-that is immensely fascinating! I've got the following
hooked up on my BBS via a Link II...

Seagate 4.5 gig SCSI hard drive
Pioneer 6-pack CD-ROM
Pioneer 6-pack CD-ROM
SyQuest EZ-135 removeable

and they all work just fine...and I've got a further question. I didn't
think that the Link II "drove" anything, but rather that it drew its own
power from the SCSI chain. Anyone care to tell us which is right? Thanks!

PS Isn't that what the little red LED (LCD?)
on the Link is for? To show enough power
is being received? ;-)

Wow, that is really fascinating! I've got the following setup on my
BBS:

Link II
Seagate 4.5 gig SCSI HD
Pioneer CD-ROM 6-pack
Pioneer CD-ROM 6-pack
SyQuest EZ-135 removable

and all works fine...(although it is picky about the order in how things
are booted up) Also, doesn't the Link II draw its power from the SCSI
chain, not "drive" other devices? Isn't that what the little LED (LCD)
on the back of the Link II is for-to show that its getting enough power
from the SCSI chain? :-)

4571. STiK help???

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-18 00:00:00 UTC
From: grovem@dontridgecrest.ca.us
Message-ID: <6cdfh6$611$2@ash.ridgecrest.ca.us>
Source record: 14045

I am having problems getting STiK up and running (again). It's been a while since I last had it installed. I can dial in, get an IP address, but no STiK clients can resolve. The connection is good as the line keeps open. I emailed my provider and asked if they had played with MTU settings or something. This was their reply.

> Q: what is the correct MTU settings for slip?

Your choice of MTU is really a matter of personal choice than anything else. Higher MTU's will usually improve performance and work with most connections, but can have a negative effect on sites using smaller packets. If you care more about quick and reliable connections, choose a lower MTU. If you do a lot of downloading and want to maximize speed, choose a higher MTRU. Below is a list of formulas for deciding the other Winsock settings based on your choice of MTU.

MTU Your choice... but no higher than 1500
TCP RWIN 3 or 4 times your MTU setting.
TCP MSS Your MTU minus 40.

Unfortunately, I don't recognize TTL or RCV_WIND at all.

I tried many different MTU settings, but had no luck. I must be forgetting some long lost secret that I one had:). Anyone remember what it was? I am using the package available on the STiK page, HSMODEM 7, under MiNT. Renaming STiK.ACC to STiK.PRG dosen't work, or at least no dialer apears.
(STiNG works fine by the way and I removed all the STiNG related files before running STiK).

Thanks,

Mike

From: Thomas Abrahamsson <thomas.abrahamsson@uidesign.se>
Message-ID: <34EC1D94.5143BF23@uidesign.se>
Source record: 13908

Is there anyway I can use a standard PC 1.44 mb drive to build myself
a second, external B: drive. Power could be taken from within the ST,
but
then? is any additioal controller chips needed, or some kind of cable
enough?

You can put your 1.44 drive inside the ST in replacement of the other one, but
you will have to make small modification: basically you want to feed the
floppy controller chip with a 16MHz signal instead of 8MHz, and make it
switchable between the old DD to the new HD mode. There are a few other
sttings to be done on the drive too.

You'll find links to several text files in the Quick FAQ. I can't tell you
about the implications of adding a complete external drive though.

Cheers,

Nick.

Actually you could modify an existing external floppie to house a newer 1.44 style floppie. You would also
need to add som wiring to it as the Atari doesn't have a line connected to see if there is a HD disk
inserted in the floppie. You will find this signal normally on pin #2 of the floppie cable. It goes from
0v. to +5v with a HD Disk inserted. You will also need a way to change the FDC (floppie disk controller)
from 8mhz to 16mhz when looking at the different disks. This is normally done with a toggal switch, though
one could do it with a small hardware modification inside the computer. And last but not lease, you may
need to upgrade you FDC to something like the Ajax chip, as some of the FDC chips that came in the Atari
don't handle the higher frequency well (16mhz). You might want to try the FDC that came with your Atari
first, before running out and buying a Ajax chip (P/N C302096 or C302434 - $40.00) It would be alot easier
just to replace the internal disk drive if you have it than it would to modify an external drive.

Choose :

* A 12 MHz 520 ST+ with SM 124 (resolution 960x544 monochrome) using
CAB.

* A Pentium 133 (64 MB) with Matrox Millennium (1280 x 1024 TrueColor)
on an Eizo F56, using Netscape on Linux.

Which one is the right hardware ? With both it gave me white pages.

Hmm. Indeed I find it more important that the pages are readable, than that
they show a great design. Certainly I'd call unreadable pages a bad design
anyway. Sorry for my pages then, as most likely you'll say that they have
no design either.

Just tried once again. I do get the background pics now. Dunno why it didn't
work first. But the background color is still white, so everybody who surfs
with background pictures switched off ...

And still the pages are preformatted to a fixed width. Stupid.

> it. It's not very fun to go through 100+ pages when they are done and

> all background colours!

Under Unix it's a matter of a script of less than 10 lines. But they use
some HTML editor obviously, so probably they do not know how.

That's not my experience. I've had it in the MODULES folder with 1.5, 2.0 demo and 2.5, and it worked with all three versions. Make sure CAB knows where your MODULES folder is.

It may be a better idea to put CAB.OVL in the same directory as CAB.APP and
CAB.RSC. The reason for saying this is that my experience of v1.5 and the
v2.0 demo is that with the module anywhere else, including inside the
MODULES folder, the overlay isn't loaded. If it's in the same directory as
CAB, it is loaded correctly and everything works as it should.

When you log in under SLIP, it usually tells you what MTU your provider
is running. If you want to be safe, set it small. My ISP used to have it
set to something like 256 bytes. Now I go PPP, so the MTU is negotiated.

Get yourself a low wattage (abt 75-100w) supply and a plug to fit the
connector on the motherboard. hook it up and away you go. I ran a ST for
years with just that arrangement. Of course the PS does have to set
outboard. PACMan

Did I say that your pages are bad? They are not, infact they are quite
good if you
ask me and why do you have to pick on the www.atar.de site all the time?
Don't
you have better things to do? They have made a misstake, but most people
wont even
notice it. Tell them insteed of just saying it's a crap page, as it
isn't. For
a change they even tries to do something usefull with the pages and
offer others
to join them with their own pages under the atari.de domain which is a
great idea.

help!
a friend of mine has a cartridge called the Desk Cart.
it gives him more than 6 desk acc's, a clock, and other stuff
attached to his cartridge port.
anyway his problem is that although the calendar will go up
to the year 2010 or whatecer, when he tries to enter the
present date as anytime over 2000, it comes up all screwy,
definately the wrong month, day, etc
has anyone such a cartridge? and experienced the same problem?

4591. ST Network Cards & Video Cards 4 Sale

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-20 00:00:00 UTC
From: Curt Vendel <webmaster@atari.nu>
Message-ID: <34EDC555.6C4BCA4F@atari.nu>
Source record: 13926
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

For Sale:

Riebl VME Ethernet Adapters for Atari Mega STE and Atari TT030 computers

Works with Linux, BSD/Net Atari, Atari Unix System. Cards will be
supplied with TOS
drivers. $150.00 each

Riebl MegaBUS Ethernet adapters for the Atari Mega ST computers
I have only 2 of these cards remaining, all others were sold
immeadiately. $150.00 each

1 Matrix TC1208 VME graphics card (spec's unknown) $350

1 Matrix C110ZV VME graphics card (256 colors out of 16 million)
1280X960 color
at 75hz, mono 4096X4096 at 125hz $350

1 Crazy Dots VME graphics card: $350

1 ISAC MegaBUS graphics card (16 colors out of 4096) 1024X768
(duochromatic) 800X600 at 50hz: $375

Atari DMA bus Ethernet adapters: These adapters work on all Atari ST's
with DMA ports on them. These card wer built by Atari in 1990 to allow
ST's to work over ethernet. These cards require Atari ST external
power supplies (not included) and I have no drivers for these cards, I
have a very limited quantity of these cards: $50 each

NOTE: Attention Mega STE owners, if you intend to purchase a network or
video card, please be certain that you have PALs/TALs installed near
your VME bus port, if the sockets are empty you will need to purchase
these chips. They can be purchased at B&C Atari Sales & Service:
916-295-9270 or www.myatari.com

Shipping: (within the contential US) is $5.00 for USPS Priority shipping

NOTE: Overseas buyers, if you are not in the contential US, shipping
will be $9.00 ground (5-6 weeks) or $14 for air shipping.

Please email me if you are interested in any of the above.

<6c9h4s$l4f1@reader3.wxs.nl>...

> My 1040 has TOS 1.0 but I could only use the harddisk with a TOS 1.4
loaded

Okay another guess (ideetje). The 1040 STF (I have one too, with a megafile
60 connected to it) has no Blitter chip right? Some blitter chips may cause
problems with DMA, and all megaST's have a blitter (and TOS 1.2 or 1.4 as
standard).

> from disk, my Mega has TOS 1.4 too (I think). Currently I have a little

I have used a 1040 with TOS 1.0 and a megafile 60, and the only thing that
is really good to have is folderXXX.prg for the autofolder.

Another problem could be if you are running multitasking software (e.g.
Magic) together with several autostart programs.

You could also try a viruschecker.

> the SCSI interface it finds. I remeber it saying something about an
adaptec
> interface on device 6 or something.

Adaptec is making host adapters for PC's, so it is unlikely that there is
one in the SH205.

Best thing to do is visit MABN in Schiedam. They have good advice and an
excellent shop. I got them to fit a 730 Mb NEC SCSI to my MegaSTE and they
will (hopefully soon) fit an extra 8 Mb and HD drive.

Cheers,

Erlend.

Yes I have the cartridge and it does do the same thing. I beleive this is what some have called the "2000 problem" It has something to do with the way the computer looks at dates and the year If you check it out you will fine that the computer thinks it is 1901 when you enter the year 2001..... Ahhhhh just a 100 or so years late!

I have both TT and Falcon field service manuals. If the new owners of
Atari want to unrestrict the copyright of the documents, I would
gladly scan all 60 or so D size drawings that some of us have paid
$50.00 each (per manual) for <sic>.
Shit, since I don't contribute by programming, maybe I can make
"shareware" drawings available (of course the cost would be to cover
my Falcon 040, Epson scanner and my time at $30.00/hr. I wouldn't
consider trying to make a profit.

Sorry, I couldn't resist:).

Mike

Who ? I took a peek at the www.atari.com, but there is nothing about ST or
Falcon.Everything is about Jaguar and one link is to JTS (present Atari's
owner?).
On JTS's site no one mentions Atari either.

Regards,

Branko.

Go to Anodyne Software's Web Page (Roger Burrows/ExtenDos PRO and soon, GOLD), and you will see whats coming up. There is a software program that is called CD-Recorder (I think!), but it is very expensive, especially when you throw in the cost of a CD recorder mech. Personally, I'm waiting on Roger's software! ;-)

]-ICD software (unless you have the pro version) is only for use with ICD's
]-host adaptor and is a red herring in your case.

I beleive that is correct. I'm using ICD's PRO version on my son's 1040
with the SH204 (20 meg) hard drive, and it works fine. It does still req.
a blank disk in the floppy drive though. (otherwise it hangs).

]- zd> Now I wouldn't be very surprised about all this if it weren't the case
]- zd> that the SH205 works fine with my 1040! ... strange...
]-Possibly because you aren't trying to load a hard disk driver from floppy on
]-that machine.

IF the SH205 boots up with a 1040 with no problems, then you should be able
to hook it up to your Mega ST with no problems either... ;-)

There is also a link to webmaster@atari.com, or some such address. I emailed this address requesting info re: copyright status of SAM, and John Skrutch replied (in a positive way :)

> On JTS's site no one mentions Atari either.

Yea, not really a supprise.

>SH205.

I have a similar, but not the same problem with my SH204. If the drive fails
and I ahve to boot from floppy only the original SH204 boot disk will work.
My ADHI 3.01 will not autoboot it for some reason. After I get the drive to
boot with 204boot disk I can format and partition with 3.01.
I can send you these original disks if you would like, however this will not
solve your current problem. It sounds similar to when I forget to turn my
laser on, only you don't have an SLM804 to forget to turn on. Honestly, I will
check deeper into this if I see no other followup posts as I am 5 days behind.
There may be an FAQ sitting somewhere on 205 and megas, but I vaguely remember
something about them and the 204/5.

When I disconnect the drive and boot with the ICD disk, it complains
>about a missing interface (the ICD link I guess). So I figured they forgot
>to give me the interface and that the SH205 was modified inside, to be

No they are not. However, if you are using an STe, it could be a bad Dma chip
or the wrong one, it is Atari:-). Also check the DMA cable as suggested. The
one on the 204 is very very short and should remain that way. Also the 204
cannot use any version of ADHI newer than 3.01.

System Audio Manager. It allows you to assign samples to system events (window open/close etc). It also allows a programmer to define new events that the user can assign samples to via the standard interface - although this didn't work correctly until I patched it (and there wasn't a utility for creating the required
.SAA [SAM Aware Application] file that worked properly until KP-SACK was released)

Go to my WWW pages for more info/downloads.

HMM, perhaps you should read Curt Vendals post. He has all sorts of ethernets for all Ataris. A dma one that has no support whatsoever if you want something to hack. However your problem is even more severe as you want to run Linux on a 520ST, and this just isn't going to happen without a 68020 accelerator or more and lots of ram and tos 2.*.

Don't look to hard it is echoed in this group, announce and atari ST:-). Not impossible just very tricky. Something for you to work on. There is possibly some potential for this if people are still using 520ST and 1040ST. Gee, I guess I am:-). However more serious is that there isn't one for a Falcon:-(.

THis is true with me as well, although I know others have it working perfectly
in the modules folder. It will not work with my ST and Cab 1.5 unless in
the same directory as CAB.APP. I suggest this route first then move it and
see if it works. It would be a little cleaner in folder.

I suppose you already have all that is needed to plug the SCSI on your
atari.
Then 2 solutions, as far as I know :
- set up the SCSI drive with the PC and use bigdos on the atari to access the
partitions of the drive ;
- set up the SCSI drive with HD Driver last version and it's TOS/DOS
compatible partition format.

I agree with the last part totally. As I do not contribute programming wise, I find that at least 60% of my time is spent looking up data for others. I enjoy that, and while it would be nice for everyone to have a copy of the manuals, I feel it would be very unfair for dealers that remain such as Best and B&C. You got your manuals for $40.00? I paid $50.00 :).

It can be pretty fustrating to get up and going. But both STiK and
STiNG work very well. I am still using V1.5 of CAB with the latest OVL
and don't have problems there. I ordered the lastest version too.
Compaired to my Mac, it's a lot quicker and easier to get on and off
line as fast as possible. Recovery from errors is much quicker too (my
Falcon reboots about three hours faster than my Mac, which does have
problems too:).

A lot of the problems I experienced are with ISPs. Even the time of
day can effect the performance of my setup. It is the same with the PC
or Mac (I think with those, you just feel more confident that the
software is "correct"). When my ISP is cleaning up its newsserver, I
can get kicked off several times until it is finished. It has nothing
to do with CAB or STiK or STiNG. It does the same thing to me on the
Mac.
Hint. Test your TOS setup when you know that online usage is at its
lowest, and find out from your provider when server maintaince is
going on.

By DMA, do you mean ACSI, the Atari hard disk port? Do you at least have
the manual or the data transfer spec? And does anyone know of any
drivers for TOS or, more importantly, Linux or MintNet support?

Why is that strange? I have 7 devices linked together and they (including my ICD link II) all behaved perfectly. (Fujitsu/seagate/toshiba CDROM/Philips CDR/IOMEGA ZIP/IOMEGA JAZ/Connor TAPESTREAMER)

I've tried to connect 8 but that was not the most bright Idea 'cos SCSI Tools uses one itself (link/software/68k). I'm running this on a MEGA STE.

Simply partition your drive with HDDRIVER 7.1 and its "TOS & DOS
Combined" option. This way you can access your drive without additional
software. You can also use standard DOS compatible partitions if you run
either Big-DOS or MagiC. The demo version of HDDRIVER is available from:

If you're connecting to the internet with a PC (you didn't specify), then all you need to do is format the disks in 720K mode under Windows, and copy the files over that way.

Cheers,

Nick.

Hi Atari user,

By cleaning up my house I found the following hardware. You can have for
a symbolic price if you want to pick it up in the Netherlands:

Atari MEGA STE computer incl. Monitor, keyboard, mouse, 20 MB harddisk,
software etc. And a buildin VORTEX AT onze 386SX emulator.

If you will buy it for aprox. 250 dutch guilder then send me an email.

Hi all.

Can this be done on a Atari, Hades or Medusa?

Has anyone ever try to connect 2 equal monitors to 1 Atari?
And use both monitors at the same time?

F.ex. running different programs on different screens, simultanious.
I imagen it would be nice to have CAB on one screen, while I use QED
to edit a *.html page on the other screen.

Or just to show off to my friends, running CAB and surfing on one
screen and using a CAD program on the second screen.

I know something like this can be done on a MAC, but how about our
machines?

cheers Joergen

Yes, they are compatible. Most modern drives are plug and play, but I
have seen some FAQ files referencing jumper and terminating resistor
problems on some models. I haven't had that kind of a problem since the
80's though.

I have seen this done with DynaCadd or Calamus. The primary display is
on a video card, and the secondary is on an SM124. I believe this was
only possible because the software supported it. Otherwise you may be on
your own to code this for your application.

I have no experience of this myself but I understand that you can have a graphics card driving one monitor and the normal computer port driving the other. Don't know about both at once though. Perhaps with Magic?

Hi,

I'm trying to put together a comprehensive help area for Atari users. This isn't meant to compete with any established sites, just to provide another resource. I've been combing sites looking for interesting help files, and then emailing the site owners to ask permission to link to the files, but it's taking a while. Therefore, I'd also like to get some input this way....
Do you have a/some useful file/s on your site? Would you like to ensure that there is even greater access to them? If so, I've put a form up where you can provide me with all relevant information. You can link to it directly at:

http://www.geocities.com/SiliconValley/Peaks/6320/ahd01.htm

if you don't feel like trying to locate it on my site.

Any information (as long as it's legal) is welcome. FAQs, hardware/software help, histories, anything.

Thanks!

Terry Ross

His answer is all fact. It is true that you can plug in a IBM style 1.44 floppie into the Atari, but without some slight modifications to the Atari you will only be able to format to 720K. This is a hardware problem within the Atari itself. Such as having to supply a 16mhz clock, some way of switching clock speeds for 730K and 1.44 meg formats, and last but not least the floppie drive controller itself may not be able to handle the high density format. Some do and some don't. Also on most of the machines Pin one on the floppie cable is on the wrong side of the plug. Just have to twist it 180 degress and plug it into the drive mech if it is long enough. Off the top of my mind I can't recall id pin 2 of the drive cable is even connected to the FDC (floppie drive controller) chip. This is the HD select line. this line will either go HI (+5vdc) or LO (0vdc) when a 720K or 1.44 disk is inserted into the drive unit. There are several text files on the net that explaines the procedure that has to be used. If you do not need HD 1.44 format than of course any IBM style floppie will tend to work.

Yes it would be possible to do this, but what would be the point of doing it. Thank about the hardware mods that it would take and the processor time that it would require. Really I can't see a logical reason to try to do this. Anyone have insight on why one would need or want this type of setup, besides saying " see I told you it could be done ". What type of practical application would require this?

I remember I have seen this with Calamus, where a 19" screen shows the full page and the SM 124 was used for the editor. But they did not run at the same time, you was abel to switch from one to another.

This was on a Mega ST back in 1989. I dont know of any other software that support this, at the moment.

Well, I guess that no one really require anyting like this, but for some
apps it could be nice.

With a graphic app. to use one screen as zoom a screen and let the other
show the full picture.

Running CAB on one screen and qed editor on the other, but perhaps it is better on a 21"
screen, where both apps. can run at the same time.
Multitasking of course.

I know it is done on a Mac, so why not on one of the fast TOS computers, a Falcon or
something faster.

As some other has stated, it has been done with Calamus and DynaCadd. If I recall
correctly, Calamus has a feature that let`s you switch between the small screen and a big
screen, if there is a big (19") screen connected to
the computer.

Long time ago at an Atari Messe in Duesseldorf I have seem this once.
I just can remember me which program they were demonstrating but I do
remember me that the program was running on a monochrome monitor on
one side and on the other side on a color screen. If the mouse pointer
was moved to the far right on the monochrome screen it appearded again
on the left side of the color screen. Nice to see.

4654. Atari TT VME

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-24 00:00:00 UTC
From: Russell Magee <bigruss@cheetah.spots.ab.ca>
Message-ID: <6cvd51$er8$2@f02s02.tac.net>
Source record: 13802

Hi all,

I posted a message to comp.arch.bus.vmebus, and just after I posted, I realized I should have sent it here too. My question has relevance to both a project at my job and my Atari TT at home:

I've never seen a VME card installed in an Atari TT. The manual says it takes "3U Eurocards". Due to the pizza-box shape of the TT case, it looks pretty obvious to me that the VME card has to lie flat (horizontally) in the case.

We are designing an embedded controller at work which uses this same scheme -- a VME D16/A24 plug just like in the TT. However, all our VME suppliers have never heard of VME cards which lay flat like this. We have to convert the VME cards we buy ourselves, by removing the "straight out" VME plug on the card and soldering on a "down" connector. This is very tedious and sometimes damages the circuit board 8-(.

Does anyone know of a company which sells IP carrier boards with this horizontal arrangement in mind? Or do all those TT graphics cards stick straight up out of your TT's case?

-Thanks,
-Russ Magee

4655. Re: Question about ST floppy drive.

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-24 00:00:00 UTC
From: John Kolak <jkolak@jps.net>
Message-ID: <34F39F1B.838097F2@jps.net>
Source record: 13803

Of course to use the 1.44 mode there must be modifications. A 16 MHz
clock must be supplied to a 1.44 mechanism to get it to work at that
density. Many WD FDC chips in ST computers are actually rated at 14 MHz,
and its not much of a push to run it at 16, but to do it properly, the
AJAX chip should be used instead.

dwmoar wrote:

The only VME card I saw had a ribbon cable coming out of the case, and
the card in a plastic project box.

If you will note that my "This is strange" message was in reply to someone message saying that more than 3 devices could not be used with the LINKII. According to Tom H. at ICD. Really funny because I have more than three devices connected to mine, and it has worked fine for some time now.

Aparently (though I havent tried it) the WD chip marked 02-02 (standard
in a lot of ST's can take 16MHz. They are alot cheaper than ajax.

Yea... one place where it really is useful/necessary, is with 3d graphics.
I know of someone using a PC like this, with a FAST 3d graphics card rendering
to one screen, while using a higher-rez on the other for debuging their code.

Not really applicable to current Atari hardware though :)

> As some other has stated, it has been done with Calamus and DynaCadd. If I recall

Yea, I saw this at a show a while ago...

Yes,- I was thinking of MagiC, and two VGA monitors at the same time,
running 2 different programs.

Even running one program on two screens will be something to show to
my PC friends.

AFAIK the early models had some problems with the blitter and was
shipped without. My Mega has a empty socket instead of a blitter...

With a Falcon and a Nova you can do this. Maybe not in the way you want,
but something similar. With MiNT you can run GEM on one screen and a
virtual screen on another monitor. I'm not sure if they can run at the
same time, but you can switch between then. And you can make programs
which
will display stuff on one screen and you work on the other. Like
raytracing
a picture on one screen and edit the object on another. This is all in
theory and I don't belive such program excist, but it _can_ be done.

As so many others have stated, it _has_ been done (and I've seen it myself). However, I doubt it's possible for an ST/STe (the one I used was a mega with Calamus), but Mega ST(e)/TT and Hades.. should probably be okay.

You might want to reference *two* different articles in a thread (which is a
feature which usenet can do, but Mausnet can't) - however, it is quite
painful to do so using an editable references line, that's why I took it out
now. It was editable from the beginning of Okami - don't ask me why, it was
not my decision.

Don't tell my Falcon that :-) Right now I'm typing this in a virtual
console running on my old 14", while my brand new 17" (driven by a
Nova graphics-card) is displaying CAB.

There's no problem in writing software that does this, e.g. a
graphics-package like Apex that use one screen as canvas and one for
control. A generic VDI/AES that can use this is not likely to appear
though, mostly because there's not enough demand for it.

Yes, it has been done. It is not directly a matter of computer type though.
To achieve this, you must:
- have a graphics card installed with its own monitor, plus the regular monitor,
- run a program specifically written to be aware of the graphics card and how
to handle it in such a way that it can output at will on any of the 2 screens.

Cheers.

SCSITOOL doesn't use an ID of its own. No software for the ST/STE can do
that because this (-> initiator idenfication) is only possible with real
SCSI, i. e. TT and Falcon.
Note, however, that some host adapters use an ID for their real time
clock, usually ID 6. This ID can't be used for any device. And the
LINK96/97 adapters have hardware initiator identifiation, using ID 7.

a Falcon or something faster.

You can write a special driver that works with just your own app, but
there is no way to do it for all apps. The VDI isn't designed to handle
multiple display devices at the same time. It has a hard enough time just
switching resolutions.

Yes it is true that the WD FDC is rated for 14mhz operation and that going to 16mhz isn't a big push for it. It is also known that some of the WD FDC still do fail when pushed to 16 mhz. The best recommendation would be to try the WD FDC first and if it work ok than fine, if not replace it with the AJAX FDC chip.($30.00) All I was suggesting that it was not just simply remove the FDC and replace it and the floppie disk and bang you have 720/1.44 capacity. It does involve some soldering and wiring changes. Also the pinout of the floppie cable on most of the Atari supplied drives are actually backwards from a standard 1.44 floppie disk drive. At least on most of the older ST's and Megas. I have found this to be the cause of failure on serveral of the machines that I have had to work on.

Well, - I guess you have a point here.
On a normal day, you never need this kind of setup.

I can only see there might be a advance if you use it with a DTP program, CAD program or with someting else, where you one screen showing the full picture and use the other screen as a zoom.

A scrooling demo will look nice to.

Source record: 13817

I'm not sure what do you mean by "rated".

If you mean that WD stated in their databook that maximum clk is 14 MHz, I think that you are wrong. I seem to remember 8Mhz stated as clk for WD1770 and 1772

On the other hand, if you mean that every 1772 will happily run on 14 MHz, even that databook states otherwise, that is big maybe and even that under more critical conditions
(e.g. tighter Vcc tolerance and/or not at full temperature range). Usually even when a FDC works on 16 MHz it does so for a short period of time, after which its internal temperature
rises slightly above what is it maximal at 16 MHz and after that it works only on 8 MHz until
cooled down for a few ï¿½C. I have burned clock multiplexer into GAL which clocked FDC with
16 MHz only at the time when it gets HD signal from floppy AND motor is on AND flopy is selected,
otherwise it would clock FDC with 8MHz. That would normaly ensure only short periods of 16 MHz clocking and more comfortable work with floppy.

>From those several tens of ST's that I have had experience with, statistic is:
-MEGA ST: almost all of them could work on 16 MHz even permanently
although not with every floppy unit (TEAC and even more MITSUMI
were ST's favourite units) and only near room temperature.
- Every other ST- 50/50 chance of working on 16 MHz for even short durations.

Even in the case of MEGA ST 1.44 Mb compatibility means to me that ST can format/read/write
all of floppy disks that were formatted on this ST and read only usually around 2/3 floppies,
formated on my PC (and perfectly readable on this same or just about any other PC).
And I am not talking about FAT's or some special sector schemes, I'm talking about that ST could not read many sectors off the floppy disk.

Regards,

Branko

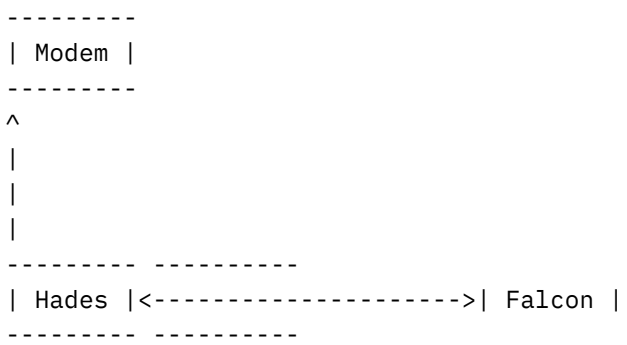
4685. STinG & Masque

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-26 00:00:00 UTC
From: ben@imperial.co.uk
Message-ID: <6d3771$7dh$1@nnrp2.dejanews.com>
Source record: 13820

Hi All,

I have been using STinG for intranetworking ever since it was first released. I have recently obtained an account with Zetnet, and I can now access the Internet from home (STinG was very easy to set up for net access and worked first time). At the moment, to access the Internet I have to disable the internal network. I would like to be able to have the internal network running, and be able to access the Internet from any machine attached to my network (which is only currently two Atari machines). I have been looking through the STinG documentation on setting up Masquerade, but although I have read this documentation several times, I am still not entirely clear on how to set this up. So, I thought that if I post details on the setup I require, perhaps someone out there in Atari land can help me out.

So here's my setup:



My Hades is attached to the modem via its modem 2 port, and attached to the Falcon using its modem 1 port.

Is it possible to configure my system so that the router knows that if the first three bytes of an IP address matches 192.168.128 (my chosen IP's), it should be treated as internal net traffic, and that any IP address that doesn't match is treated as external traffic and routed through my Hades so that it can get out onto the Internet?

I am currently using the latest version of STinG, downloaded from Peter's WEB Site two weeks ago.

I know that this is quite a lot to ask, but any help would be appreciated.

Thanks.

Regards,

Ben Hills.

That's a bit like asking "what is the point in having two desks?". And yet
that's what we all have at my work ...

My girlfriend used the love the way that she could plug her PowerBook into
a larger monitor in her office, and automagically have two screens which
acted like one big one (could drag&drop windows and icons from one to the
other, etc.). Now they've given her a new Mac on which this doesn't work
any more, and she misses it real bad.

BTW has anyone any idea why this would not work on any Mac? I always
thought it was a Given. Girlfriend thinks it has something to do with
the fact that the video connector is PC-style rather than Mac-style, but
I'm not so sure ... (horribly off-topic for this group, of course :>).

4688. Mega STE questions

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-26 00:00:00 UTC
From: jbg@enterprise.aacc.cc.md.us
Message-ID: <34f57e49.0@aacc-alpha>
Source record: 13823

I've just opened my Mega for the first time yesterday, and now the questions!

1 - I've noticed that there are 4 30 pin SIMM sockets, I have 2 SIMMS in there now. I can I use standard 1 meg PC SIMMS? Parity/non-parity?

2 - My floppy is acting kinda strange, it will read a disk, then it won't, when I eject it and put it back in it doesn't want to see any of the files. Now I know that the Atari drives are backwards from PC. On the cable, pin 1 is marked with a red stripe, which is connected to the motherboard as marked pin 1. So I know that is connected correctly. Now, that pin 1 of the cable is connected to pin 30 something on the floppy. Opposite of how a PC's floppy is connected, I guess this is why the Atari is backwards from the PC? I'm trying to figure out if the floppy is connected incorrectly, which could be making the read errors.

Thanks for any help, also is there a memory upgrade for the Mega, so I can put more than 4 SIMMS in it?

Yes that might be nice to do for DTP or CAD, but would it really be worth the expense of the hardware needed to do such? Also how about the software that would be needed to drive the system ?

Absolutely. Don't worry about parity. That a useless PC thing. Also, make sure the ones that are already in are the same size. You shouldn't mix 256Kb and 1Mb simms, although I'm not sure about Mega STE memory configurations.

If it was the wrong way round, it wouldn't work at all, and might not even boot up.

It sounds more like corrupted disks or a bad drive.

Is it a replacment drive or the original drive ? If you recently replaced it, it could be a configuration jumper problem on the drive, maybe the media change one.

>Thanks for any help, also is there a memory upgrade for the Mega, so I can
>put more than 4 SIMMS in it?

Yeah I have heard that this WD chip can work at 16mhz. I have also heard that its failure rate is also high. I
think to do the upgrade right would be send the bucks and get the AJAX. Yeah it is $$$$ but in the long run it
is a less pain in the butt.You can go cheap now and pay for it later! I would prefer to have something that is
going to work and do it well, than to have something that may or may not run right, and will end up haveing to
do it over.

Source record: 13827

Try detailed cleaning mechanism of your floppy, if you think that you could assemble
it back. From your description of the fault it could be that mechanism does not travel
it's full way down at disk insertion.
If you peek at the left side of the inserting hole, you should see at the left side two pins
from the two switch sensors. One is used to sense write protection lid on the disk, while
other sense presence of the disk in unit, so that electronics in floppy drive spindle motor
only when disk is in unit.
If your switch is bad or there is some dirt in mechanism which prevents action of switch,
floppy will not recognise that disk is in it, so motor will not start running...
Dirt in mechanism can also sometimes cause incorrect contact floppy heads with media,
so that also could be the cause.

Regards,

Branko

Hi!

I have recently got (re)interested in my the Atari ST(e)'s which I've not used for over 4 years. (I was into the ST BIG sytle then! 68K assembly & Hardware hacks).

Anyway,

I want to run a SCSI HD with it and need a DMA to SCSI convertor card. Does any Company still make these? If so, who? Or does anyone have one for sale? (In the UK).

Any help gratefully accepted.

Nigel

So guys,

Thanks for your help.
And I had to be more specific.

Now, I hope I'm more specific
So I told ya that I have a 1040 STFM + dd-drive
I use a pc for downloading.
And the programmes are Zip-files.

So I tried, what you have written but now there's another problem

I had downloaded a program which was zipped but when I unzipped the program
I got a file which was too large to put it on a 720k floppy. How can I fix
this problem????

Greetings Wilco

Get ST-Zip, or another similar program. Keep the file zipped as you put
it on the floppy, and transfer it to your ST that way. Then use ST-Zip to
unzip the file on your ST (although if you don't have a hard drive
attached to your ST you may still have trouble unless some part of the
files can obviously be put on a separate disk, but in that case the easist
thing would be to do that up front and not bother with ST-Zip).

Obvious, perhaps silly question: Does she have two video cards? In order
to run two monitors, you need two cards.

I've used Macs this way, and it is really very handy to have one larger
display for the main document and a smaller (15") display for all of the
floating palettes that an app like Photoshop uses.

Use ST Zip 2.6, then use it to just extract a selection of the files
to fit on a floppy disk... if one of the files itself is larger than
720k, then you may have a problem. You could always upzip them on the
PC and sort them from there?...

: I am new to the Atari world. I used to own an 800XL and a 520St for a
: short time. Never kept up with the Atari technology. What is a
: better buy, a MEGA STE or 1040ST??

: Pros and cons to both would be great!

Briefly:

Atari 1040ST:
- 8 mhz processor
- Difficult/expensive to upgrade RAM
- Mono sound
- One serial port
- Integrated Keyboard
- No internal Hard Drive
- Earlier more basic operating system
- More compatible with games

Atari Mega STE:
- 16 mhz processor
- Easy/cheap to upgrade ram (4 1meg SIMM slots)
- Stereo DMA sound
- Multiple serial ports (2-3)
- Separate CPU/Keyboard
- Internal SCSI Hard Disk Bay
- Later Operating System with more features
- Less compatible with games

In general, if you want to play games, the 1040ST is more appropriate,
because the earlier operating system is compatible with almost all ST
games.

If you want a computer for application software, music, or
graphics, the Mega STE is a more appropriate machine.

Also consider:

TT, similar in design to the Mega STE, but much faster - best for MIDI
sequencing, desktop publishing, and application software.

Falcon - very good for graphics, application, digital audio, and MIDI
sequencing software, and although it has the same case design as the
1040ST, it is much faster and has an interal hard disk. This was Atari's
last computer released.

4703. ST-Guide requirements?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-26 00:00:00 UTC
From: Emile Talbot <aecn.talbot@sympatico.ca>
Message-ID: <34F65F97.1AB9@sympatico.ca>
Source record: 13838

I just tried installing ST-Guide 1.4e on my 1040STF running TOS 1.0.
It doesn't work. It crashes the computer and then causes an immediate
reboot. What are the requirements for ST-Guide. The documentation is
in encoded in a binary ST-Guide format which I cannot read without
ST-Guide.

If the requirement is a newer version of TOS, I will just toss ST-Guide.
Whenever I have seen TOS roms advertised the price is roughly $30US. My
ST is primarily for play and I am unwilling to pay any substantial money
to upgrade it. For me $30US is about as much as the ST is worth.

Thanks for any help.
Emile

>
> Not really applicable to current Atari hardware though :)

Why not ? You can run two copies of VDI, one for each screen, on different
traps, then patch all "trap #2" in the rendering code into "trap #3", say.
Should not give any problems as long as the rendering code does not use
AES or VDI input functions (which are very rarely used at all).

I agree however this is nothing a mainstream user would be capable of ...
;-)

I'd go Mega, it has a VME slot for a video card/net card. Some have built in SCSI, along with of course the standard external ASCI. I have both a Mega STe and a ST f, and I prefer the Mega. Both have midi, the Mega runs @ 16 MHz, ST @ 8. The Mega can use standard PC simms, 30 pin, the ST can't AFAIK! But these are just my opinions, anyone else?

Slightly off-topic, but:

In the Nova Scotia Atari Computer Users Group (still alive if a bit pale & sickly) we have been trying to split the signal from a 1040 STe to drive 2 SM124 type monitors. Still unsuccessful but what other options are available for club software demos & lectures?

TAF always used a Falcon which interfaces wirth IBM stuff as far as the VGA output so they can use the overhead projection equipment from the world of big business.

1) Unzip it on the PC before transfer.
2) Use a ramdisk. I understand that your problem is that the ZIP file, plus
the decompressed file won't fit, so copy the zip file and STZip to the
ramdisk, then run STZip with the command line -e M:\archive.zip A:\

Definitely get the Mega. it runs at 16MHz, has DMA stereo sound, blitter,
hardware scrolling, 4096 colour palette (512 on the ST), easily expandable
SIMM sockets (up to 4Mb), updated TOS 2.05 or 2.06. Optionally it may have
internal SCSI adapter and maybe a 1.44Mb floppy drive.

Cheers,

Nick.

No compariosn, get the Mega STe!!! Its got the built in hard drive, latest version of TOS, a HD floppy (sometimes its TOS 2.05 and a 720k floppy), memory is by SIMM slots, its over twice as fast (16 mhs 68000 CPU and a blitter chip), separate keyboard, lan port, option for an FPU, oh heck- the list is too long, get the Mega STe! ;-)

The aixit MagnumMSTE is a plug-and-play device for the MSTE that gives
you 8Mb fastRAM. AFAIK you install it by removing the CPU, plug the
card in the CPU-socket and plug the CPU in a socket on the RAM-card.
It runs at 16MHz so it's just as fast as the cache.

I do not beleive that the ST has enough drive to display on two screens at the same time. What one might be able to do is use the ST to drive a video amp and than use that amp output to drive two monitors. This would be assuming that you were using the same type (color / color or monochrome / monochrome not a mixed setup such as color and monochrome). Just a thought

Perhaps it would be cheaper to buy a MegaSTE than to upgrade an STf to do the same type of work. You could get the ST cheap, but upgrading it would cost.

well, AFAIK, there arent any high performance 3D graphics cards for Ataris
at the moment (read my example!). Of course others have provided other
examples which do apply to Ataris, but I was refering to my example...

I want to purchase an Atari ST for the sole purpose of playing games.
I posted a messages asking which was a better buy: MEGA STE or 1040ST

It would seem that the 1040ST would suffice for what I am looking to
do. Although I can get a 520ST a little cheaper. If all I want to do
is play games, can I get away with purchasing a 520ST. Is it
compatible with every game ever created? Lots of questions.......

>
> My Hades is attached to the modem via its modem 2 port, and
> attached to the Falcon using its modem 1 port.

Ok, let's say the Hades is 192.168.128.1 and the Falcon is 192.168.128.2.
Now the routing tables:

Hades :
192.168.128.2 255.255.255.255 Modem 1 0.0.0.0
0.0.0.0 0.0.0.0 Modem 1 0.0.0.0

Falcon :
0.0.0.0 0.0.0.0 Modem 2 0.0.0.0

I suppose the Falcon is set up correctly, if you use a routing table like
indicated above (which is also good for your Intranet). The Falcon does
not need to run MASQUE.STX or the Dialer.

The Hades will need MASQUE.STX. The first route ensures the Falcon is
always reachable. The second entry (default route) is changed by the
Dialer to point to the Internet if you've got the Dialer's "Add default
route" option switched on. You also should activate the Dialers "IP
masquerading" option. Your Intranet is operational after you've set
the ports (Hades' Modem 1 and Falcon's Modem 2) to the right IP addresses,
same protocols, and active.

Now the Internet should be reachable from both machines after you dialed
in using the Dialer, employing the abovementioned options.

> Is it possible to configure my system so that the router knows that
> if the first three bytes of an IP address matches 192.168.128 (my

> chosen IP's), it should be treated as internal net traffic, and
> that any IP address that doesn't match is treated as external
> traffic and routed through my Hades so that it can get out onto
> the Internet?

Given the abovementioned routing tables, this should be the case. If
you want to add more machines, you need to modify them again.

Cheers Peter

I created a special ASM stub program and structure definition which
allows me to write the rest of the driver in C.

I have a standing offer to write a PGS driver for any printer in
exchange for the developer docs.

Out of the ether, the following was mentioned by Peter...:

PR> STinG does not support CHAP at the moment, only PAP. I do not
PR> think PPP-Connect does support CHAP either. Maybe MiNTnet does, I
PPP-Connect probably doesn't as I still can't get it to work correctly on my
PAP connection either (still sends the authentification twice, resulting in
the second, now incorrect password to invalidate the connection. But now I
can get through with STinG why bother! ;-)

PR> don't know. Since most MiNTnet applications are straight ports of
PR> the Unix versions,
PR> this has some likelyhood.
Which is a shame as Mint is a bit painful for me to use.

PR> CHAP is considerably more complex and complicated than PAP, and
PR> *very* few people require it.
Yep, I can understand that. The likes of MD5, handling unannounced
authentification requests whilst in the middle of something else, etc, don't
seem that easy to implement.

My setup right now is as follows:

I use ppp with dynamic ip to connect to my isp.
The modem is attached to my Mega STe Modem 2 port.
I have a Win95 pc attached to the Mega STe Modem 1 port.
The pc has ip address 192.168.1.3 on my local net and the MSTe is
192.168.1.1 running uncompressed SLIP.
I also have a STacy connected to the MSTe via midi. The Stacy is
192.168.1.2 on my local network.

Starting with a working ppp connection to my isp I have added these
settings to be able to have full Internet access on all three computers.

STing Port Setup cpx:
Masquerade: Not active
Addressing: IP Address: 10.0.255.1 (default)
MTU: 576
General: Masked Port: Modem 2
Masking IP: 10.0.255.0 (default)
Modem 1: Active
Addressing: IP Address: 192.168.1.1
MTU: 576
General: SLIP
Modem 2: Not active
Addressing: (No IP address)
MTU: 576
General: PPP
Midi: Active
Addressing: IP Address: 192.168.1.1
MTU: 576
General: SLIP

DIALER.APP config:
Miscellaneous: Select "Use IP Masquerading"

ROUTE.TAB:
192.168.1.2 255.255.255.255 Midi 0.0.0.0
192.168.1.3 255.255.255.255 Modem 1 0.0.0.0
0.0.0.0 0.0.0.0 Masquerade 0.0.0.0

DEFAULT.CFG:
Internal Sting memory raised to 200000 bytes.

I have got up to 2700-2800 cps when downloading big GIF:s in CAB on the
Stacy. This was with TOS 1.4 and not moving the mouse!
But suddenly today after I had tried to connect the pc to the MSTe
Ser.2/LAN port the midi connection is totaly gone. Instead of the Midi
entry in the STing Port Setup cpx and the Dialer statistics dialog there is
now a SERIAL2 entry. Very strange!
I have tried everything from a complete new Sting install to comparing file

contents with Egale but itï¿½s still a mystery. The only place I now have a Midi port entry is in the SERIAL.CPX so the link to the Stacy is dead. On the Stacy though, the Midi entry is still in place. Possibly the MSTe is beginning to think itï¿½s a pc and therefore starts making decisions all by itself... Perhaps running a shell and type format c: can help :-)

/Kenneth Medin

They released the software code to write your own drivers, but from
what I understand, it's in assembly lanugage and many don't understand
it. I wrote them awhile back asking for some documentation on this
and they said they hadn't even booted an Atari in a couple of years
and didn't have any with a HD anymore anyhow. They do have a web page
where they are pushing the Mac & Amiga versions.

I don't know if your interested or not, but on the Systems for
Tomarrow web page, I saw they had a $99 package for a
1040ST & Color Monitor. Not a bad deal if they back it for
any timeframe. I've used them before and they are very
respectable. They are located in Independance Mo USA.
I can give you a web page if you need it. Just let me know.

Mike

Source record: 13863

If you are looking for same picture on all SM's and you can open ST and add some electronics inside, then it's (relatively) easy. On the video shifter you get monochrome
video signal (pin 30, I think) which you have to buffer N times (N being the monitor number)
and for each video output you have to add transistor and a couple of resistors&caps
to get right voltage level for monitor. You can do the buffering part with 74HC244 and for
voltage adaption (& impedance match) I can send you wiring & part list.
Same goes for syncs, except that you don't need changing voltage levels for that, so HC244 will
do alone.

BTW: In color modes you could drive each color signal to one monochrome monitor (not SM 124-
it has to be PAL compatible) and thus have up to three independent pictures, or maybe even four with
a little fiddling with shifter's output signals, but it would require quite some software, since
TOS video drivers would probably be unusable for such arrangement.

Regards,

Branko

4729. Beta Systems Supper Charger?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-28 00:00:00 UTC
From: "Peter B. Franck" <peterb@revealed.net>
Message-ID: <34F7C068.646C@revealed.net>
Source record: 13864

Hi Atari fans!

I am a Apple II enthusiest crossing over to become a "vintage computer enthusiest" recently I bought a 520 ST with a SC 1224 monitor and a harddrive enclosure that the guy called a "super charger" no disks, no manuals, (gave $65) he claimed it worked..... but that is another story.
Any way I have got it all running (haven't checked the flopy drive yet , think it's a doubles sided) and I have a few questions that I can't seem to find answers to in the FAQ's.

Inside the hard drive enclosure there is a box called " Beta Systems Suppercharger" , an "Advantage Plus ST" SCSI card? a Segate ST-296N 85 meg hard drive a power supply and cooling fan.

I know this set up is a ACSI to SCSI interface but are there any special feachers that I can take advantage of? Can you give me a more accurate discription of what I have, I mean increase my understanding of the function of these devices?

There are some utilities and documents on the hard drive that seem to apply like "Supper Carger Toolbox" and "Supper charger Ramdisk" but these are written in German. Is there an english translation? can someone heip me to understand these?

The 520 ST seems to have 512 k of ram solder in and another 512 of socketed ram is this right? the FAQ's seem to indicate that the 520 was all soldered ram and expantion required board modification.

Thank you all for your help in advance!

pete

Yes I have been there and seen their web page, and it does nothing for me. Yeha alot of hype. and I almost get the idea that they want us the Atari users to go to the IBM so we can use PageStream. Bull shit if I am going to support them... They can't or won't support the Atari, I won't and will not help support them thru the use of the IBM program. Give me a really good reason that I should. Their attitude really sucks when you call them and ask for help. I don't need and don't what that.. I use PageStream because I think it is a great program and like the ease of it. Better than Quark Express - pagemaker- and those. I like it alot better than Calamus, thought I have to admit I haven't used Calamus alot. Anyway these are just my thoughts.....

Hi Wilco

There is a program called splitter that splits the file into useable
chunks, you can then recreate them on a hard drive etc...

I use it to shift large PC files I download using an STE from my hard
drive.

If you need this program, please email me and I'll hopefully attache
it to an mailing for you.

It is public domain.

Cheers! for now
Steve

Peter,

What you probably have is a 520 STf and someone installed the extra sockets for RAM that are left vacant in a 520, but filled in a 1040 STf(1 meg). The Supercharger is a 8086 processor board for the ST (look on the circuit board, you'll see an Intel clone chip from a european company, can't remember who made it off the top of my head). Apparently, the former owner took it out of the original case and put it in the hard drive case. You need the Supercharger drivers and DOS (I believe 3.2/3.3 was reputed to be the best for 8 bit processors) to do basic PC stuff with it.

Really not very useful, but it sounds right up your alley.

Dan

Happy falcon owner wishes to know.

What is the fastest modem that works with the Falcon at full speed?
Such as my ST is limited to 19200baud.

How can I connect an external drive to the falcon? I would like to adapt
one of my old 720k drives, or use a 360 replaced with a 1.44 mech.

As soon as I am sorted out, I will be using both machines on the Internet.

Later Brian.

Get either for as low as possible price. THE MEGA STE is better hands down.
Of course a TT and a FALCON are even better than the Mega STe which is the
direction I just went today;-). I just returned to the Atari world as well.
Glad to see I too have not been residing on another world alone:-).

>
>Pros and cons to both would be great!

1040ST cheap, older Operating system, limited expandability.
MEGASTe. Easy to add ram. More Upgrades available. Doesn't run as many games.
More expensive. Graphic cards made for it.

Both can get you on the internet. MegaSTe still better.

>ST-Guide.

Yes, I have trouble with My ST TOS 1.0 machines in all memory configurations.
However if you use a HARDDRIVE the problem goes away with lockups and crashes.
Don't know why. However, I did find that if I ran ST GUIDE as a PROGRAM and
not as an ACC file it works flawlessly.

>
>If the requirement is a newer version of TOS, I will just toss ST-Guide.

$30, I hope there is a harddrive with it for that kinda money;-).
Just kidding, you should be able to use ST guide as I suggested. I use it
on my 520ST with 512k as a program with NO PROBLEMS. Only problems as an ACC.
Also no trouble when run off my HD. No Idea why that is.
Later Brian.

The new flex modes will work. 115.2K DTE. The Hayes Business modem
(read about $250.00) with work at 230.4K DTE, but not sure how HS
Modem and the Falcon work at that speed. Forget about baud, just get a
cheap 33.6 or 57.6 flex.

Actually I was trying to run it as an ACC on my HD. However, I have
since
found out that it was conflicting with Atari's GDOS 1.1 which was
starting
from the AUTO folder. After removing the GDOS (which I am not sure I
need
anyway), it now works fine.

Thanks for your help,
Emile

>is play games, can I get away with purchasing a 520ST. Is it
>compatible with every game ever created? Lots of questions.....
>
>

```
Th only difference is memory: the 520 has 512K and the 1040 has 1Mb. Other
than that, some 520ST (the earlier ones) came with a single sided floppy,
instead of a double sided one, so even if you just want to play games, get
the 1040. Some of the later games required 1Mb or a double sided floppy.

For anythng else, get the Mega STE if you can.

Cheers,
Nick

4739. How to get SCSI Zip running w/BigDos on Mega ST2???

Newsgroup: comp.sys.atari.st.tech
Date: 1998-02-28 00:00:00 UTC
From: Charlie Wood <spidersi@sprint.ca>
Message-ID: <888807913.953831@michelob>
Source record: 13874

I have a mega st2 and ICD's FA*ST acsi to scsi box with an 85Mb scsi drive
inside.

I also have a scsi zip drive that I would like to use to transfer files that
I download
with my PC onto the Atari.

I've read on this newsgroup about BigDOS and HDDriver being used to do this
but haven't a clue how to do this.

Could anyone be kind enough to send me instructions on how to set up
BigDOS and HDDriver to see my zip drive.

I should mention the TOS on the Atari is 1.02(1.2) <-- Will I need to
upgrade this??
Also the scsi ID on the ICD box is set to 0 will I need to change this when
I add an
external device??

Thanks in advance.

The Mega STe should be compatible with Cubase as it is with Notator SL.
You have to change some defaults in the Control panel to eliminate
conflicts but it runs OK otherwise.

You can hook up a 56K modem, or a 128K ISDN line. that's the fastest
equipmemt available right now. The limitation is no the Falcon.

>How can I connect an external drive to the falcon? I would like to adapt
>one of my old 720k drives, or use a 360 replaced with a 1.44 mech.
Don't bother: get a Zip or a Jaz drive instead. Besides, there is no
facility on a Falcon to connect an external floppy.

Hi!

> What is the fastest modem that works with the Falcon at full speed?
> Such as my ST is limited to 19200baud.

It works well beyond 115.2k!

> How can I connect an external drive to the falcon? I would like to adapt
> one of my old 720k drives, or use a 360 replaced with a 1.44 mech.

You have to make a special cable and connect an extra wire to the
soundchip.
Mail me if you need more info.

Good luck!

Just get a 30inch monitor:-). The falcon only supports one monitor as far as I know, unlike the TTs and Megas. Also the stock falcon doesn't support the high resolutions like 1280*960 of the early TTs.

Hi
Could someone email BINARY files of the two EPROMs need for TOS2.06 in an STE. I have the STFM ones but now I have an STE.

I have two 28 pin EPROMS under the diskdrive. They sit in 32 pin sockets.

I will also need to know which tracks to cut to get the power to the correct pins. I DO NOT want to be able to switch back to TOS1.4

Thanx

Brian

It is a 520 STfm. I put my glasses on! :-) I didn't see the little fm!

the drive formated a 800k disk ok!

thanks Brian!

ok, does the mega ste have a cartridge port for the midex+ to go in?
I am not at all familiar with the mega ste. I got the atari 1040st for
the midi capabilities and the $$$ amount it cost. My midi is a hobby and
I wanted to get as good as I could for the $$$ I had to spend. I think
the Atari is super for midi. I do wish it worked a little faster when I
am editing the scores though, that gets boring sometimes. Maybe the mega
would be quite a bit faster at 16mhz.

It should be possible to create a VDI driver for a second monitor by
treating it as a printer (20-29), but it would be a display only
device (no AES/mouse support). The problem is getting documentation
on how to write a VDI driver for any of the GDOS implementations.

Dear Atari owners,

I am wondering if anyone can help me.

I own an Atari Mega 1 that I use for music. It originally came with Microsoft Word for ST and I currently need to do some word processing on it.

Unfortunately, though I still have the mauals and documentation, the Word disk was stolen and I need to get a replacement. Does anyone have a copy of Word for ST they can send me or email me?

Please email me directly since I do not receive all postings to the group.

Thank you for your assistance,

Robert Davis

p.s. Please don't flame me about software piracy. I have purchased all the software I use, I do own a licence for this package and this package is not currently sold commercially.

It's a Mega1 ST. There was never an Atari NT. Maybe someone modified the
badge for some reason.

>disabled. Changing it from low to medium help a little.

Ok, here's the topo regarding ST screen resolutions:

-Colour monitors (SC somethings) or TV sets ONLY display Medium (640x200x4)
and Low resolution (320x200x16). 99.9% of games NEED a colour monitor.
- Monochrome monitors (SM) ONLY display hi-res (640x400x2). Most serious
applications require at least 640x400. Some crash, some give a bad display,
some just won't run.
- The ST automatically detects what screen it is connected to when it boots.

This means that you need the monitor that goes with the type of application
you will be using.

As far as Cubase goes, you'll need a monochrome display such as the SM124 or
SM125. There's nothing wrong with your machine.

There are monochrome emulators, such as Sebra, that can trick your machine
into thinking it has a mono monitor when a colour screen is connected. This
cannot be suggested for serious use as it makes the screen flicker and slows
down the system enough to make it unusable for Cubase.

Cheers,
Nick

4762. ST to PC file conversion

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-02 00:00:00 UTC
From: Donald McLaughlin <donald@michiana.org>
Message-ID: <34FB8A31.AF4D9FCD@michiana.org>
Source record: 13757

Is there a way to convert ST doc files and/or txt files my PC. The PC won't read an Atari formatted disk and the ST won't read a PC formatted disk. I formatted a disk on the PC for 728k, but the ST doesn't read it. I was told that it might.

I need to get some old doc and txt files converted so I can work on them on my PC. Is there a program that will allow my PC to "read" the ST disk?

Thanks,
Donald M

>piece. You need MSDOS 3.2 or higher I think.

The Supercharger (I have one sitting before me) is considerably better
than an 8088. It uses a 10mhz NEC V30 which was nominally an 8086
equivalent but had all the 80286 instructions except those for
switching to protected memory, so it would run Windows 286 (for
whatever that was worth). Graphics are CGA without the character
attributes on both ST med and mono monitors or Hercules (with
side-to-side scrolling on the mono). It has a slot for an 8087 and
runs things like Lotus 1-2-3 for DOS very nicely.

It came with DOS 4.01 for IBM work and a rather powerful toolbox which
was never much exploited for use from the Atari side. It makes a nice
1 meg reset-proof ramdisk. In IBM mode it is possible to multitask
with TOS.

The Supercharger has the distinction, apart from being one of the few
different (from hard disks) devices to use the DMA/ASCI port, of being
the only hardware DOS addon that will run with any Atari.

This is easy. Simply install HDDRIVER as explained in the manual and put
Big-DOS in the AUTO folder. If I remember correctly Big-DOS should be
the last program in the AUTO folder.
Note that if you partition your media with HDDRIVER's TOS _and_ DOS
compatibility option you don't need Big-DOS at all for data exchange
between PCs and the Atari.

Actually that's illegal, since not only TOS is still licensed, but there are still dealers selling these and you would be ripping them off.

I don't understand what "STFM ones" you are talking about, but if you already have TOS 2.06, then you can dump the image. Also, the chips should be the same, since 2.06 was only available in two 32 pin chips.

TOS 2.06 Eproms for STFM or STE should be the same.

>I have two 28 pin EPROMS under the diskdrive. They sit in 32 pin
>sockets.

Those should be ROMs, not EPROMs, unless it has already been upgraded. TOS2.06 ROMs will have 32pins.

>
>I will also need to know which tracks to cut to get the power to the

There are no pins to cut, just 2 jumpers to set (well, 0 Ohm resistors actually) next to the ROMs. Instruction can be found from the Quick FAQ.

Most definelately not, I have MiNTOS (including MiNTnet) on my
AB/Falcon and it's extremely stable. I think you should have a look at
what else you have installed (e.g. running HS-Modem after MiNT can
cause problems).

4771. Mega1 and resolution

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-02 00:00:00 UTC
From: "M.J.Kallen" <tw416391@dutiwy.twi.tudelft.nl>
Message-ID: <Pine.HPP.3.90.980302154455.14208A-100000@dutiwy.twi.tudelft.nl>
Source record: 13894

I have two questions:
1. I am trying to set up an Atari I borrowed from a friend to run
Cubase 2.0 and this Atari is a Atari Mega1 NT. It's says NT on the unit,
but I've never heard of NT before. What is it and does anyone now some specs?
2. The system seems to working fine. but everything is very large
on the screen (Atari color SC1425). When running the program everything
(all the buttons, the menu and bars) are overlapping eachother. Because
it doesn't fit on the screen it wraps it around and restarts at the other
side overlapping whatever it just put there. The screen is attached with
one of those large Smart card connectors and I thought the problem might
lie there. Maybe I should use the 8-pin TTL RGB input? I also tried to
change the resolution in the desktop area, but the HIGH position was
disabled. Changing it from low to medium help a little.

Thanks in advance,

Martin.

P.S. Please reply to my e-mail address too!

It has the cartridge port so your gear should work. Cubase really should
work in 16MHz, but if it didn't, you could still go back to 8MHz mode.

Cheers,

Nick.

That's still no excuse -- international mail-order is available to almost any country. As a Canadian, it bothers me a great deal that I now have to buy software from the United States (the exchange rate, as you know, is 'brutal'). But some Atarians in other countries are in the same situation when it comes to there being no national dealers. This can make software and hardware purchases more expensive, but the 'fair' route is still there.

I wonder if Nima Monaster at Homa Systems House has ever thought of filling this 'void' in Canadian dealers? It would be great to see him add ASH product and other stuff not available here. I was forced to buy HDDriver and CAB from Systems for Tomorrow (who provided very good service).

As for the original topic, if I read things correctly, the guy should be allowed to make a TOS image for his own use since he actually owns an STE.

International Mail Order is fairly easy ... it just takes an
extra few weeks for things to get through customs. I have ordered
directly from the UK when I couldn't find what I wanted at a
USA dealer, but I'd rather patronize a "local" dealer than
import.

Hi Martin. I'm assuming that you are referring to Canada? <smile>
We have several fine Atari dealers left just south of you in the US.
Try Systems For Tomorrow, Chro-Magic, ATY Computers, Al Hortons
Computer Dungeon (great used stuff!), and a few others... I'm sure
they would be more than willing to ship to Canadian Atari owners.

BTW, SFT had TOS 2.06 ROMs (used) going for only $35.00 at one time.
At those prices, I can't see any justifiable reason not to get them
from a legitimate dealer... ;-)

The Atari market (to me) is more interesting -now- than at any time I've
been involved in it. Can't imagine why anybody would want to quit...! ;-)

Yes, the Marpet Xtra-RAM (or whatever...) Deluxe will work fine. It
has four 30-pin SIMM-slots for 1Mb SIMMs.

> If not,
> I'm a dead shot with a soldering gun,
> so if anyone can email me schematics and instructions.

It's possible to solder in the missing RAM (and capasitors), but
according to a old Swedish Atari-magazine I have you must replace the
old chips with chips with lower power-consumption. I don't know if
this is entirely true though...

I have a New Falcon I jsut purchased.

It has a Conner 80meg Ide and a Syquest 270meg removable scsi.

The conner was formated as C&D in two 40meg partitions.
The syquest booted as drive E.

However the syquest wasn't being address, it could be identified but nothing
read or written to it.

After reading the hd manual, I figured I could tackle this myself and after
much thought decided that this was an UNFORMATTED Cartridge.

I decided to format it and after reading the manual figured the IDE would
be left untouched. I know nothing of IDE drives which is where the problem
begins.

I must have screwed something up in setting the partitions.
I set up two 135meg partitions on the syquest, hopefully as E&F.

After formatting, I rebooted only to discover the Syquest is C&D, works perfectly
but the IDE is GONE.

The IDE boots some atari symbol, acknowledges the conner, does a memory test
then boots HD driver which seems to boot the Syquest.
After which there is no conner drive to be found.

There is NO IDE Drive however anywhere.

If I disable the syquest I STill have no IDE partitions.

I think somewhere I forget to say there is an IDE as C&D and now I Can't.
I am booting hd driver software from disk now as it was on the conner:-).

1)How can I get the Conner back as C&D.
2) Have I lost the data on the Conner? I don't think so, however I don't
know how these drives boot in the first place.
3)Please try to guide me as to what I have done wrong.

I think I am in an endless loop:-).

I hope I can get the ide back even if the files are lost. Then I hope
I can have both drives working:-).

Thanks to ANY WHO answer in advance.

I am not panicking yet, I ahve 270megs I can use on hte Scsi;-). So I did
half of it right.

Finally, what does one do if they ever have to format and IDE drive?
I read the atari manual and the hd manual and no one talks of software to format the drive.
Do you just throw it away when you have a problem?

Later Brian.

>it hook to the Falcon?

An ISDN line is a digital service you get from your phone company. It
offers anything from 1b+d to 2b+d (which is needed if you are going for
128K. Each b represents a 64K connection, the d represents a 16k
connection and is used for setting up the calls. (the b links do not
carry the call connection info.)

To use ISDN with a computer, you also need an ISDN modem (its not a true
modem but was easier for them to sell it to the public as such than to
invent a new term to use.) You then use any communications software
you want and away you go. (I suppose you may need a driver to set up
the modem - unless commercial ones follow some established standard
like the Hayes instruction set.)

I think we have had enough fun at his expense, so to answer his question...

What you have is most likely Microsoft WRITE, not WORD. Microsoft dropped
support for this product within a year of introducing it. They reasoned that
if the
Atari users were not willing to support Microsoft they would not support
Atari.
This was the result of really bad reviews of the software, and a general
bashing
of the product by those that claimed to have purchased it.

I have not seen a copy of this in years. You would do much better by
getting
yourself a copy of WordUp.

Brian

4788. Mega ST Blitter Chip and TOS

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-04 00:00:00 UTC
From: Tim Curtis <sexsymbol@execpc.com>
Message-ID: <6dis4n$e05@newsops.execpc.com>
Source record: 13773

I just acquired a Mega ST4, which is good because my 1040STFm is on it's last legs.

According to the Profiling program I ran, the Mega ST4 does not have a Blitter chip. I thought that all Megas had blitters, but I could easily be wrong. Could someone please tell me where it would be physically located on the board?

Also, the Mega has TOS 1.2, my 1040STFm has 1.4. I assume I can transfer the 6 chips into the Mega, but what else do I have to do?

Thanks,

Tim

There are no unformatted cartridges. New drives and cartridges always
are factory-formatted.

> I decided to format it and after reading the manual figured the IDE would
> be left untouched. I know nothing of IDE drives which is where the problem

Yes, the IDE is left untouched. HDDRUTIL doesn't support formatting IDE
drives anyway, refer to the manual for an explanation

> The IDE boots some atari symbol, acknowledges the conner, does a memory test
> then boots HD driver which seems to boot the Syquest.

If HDDRIVER is booted from the IDE drive and the drive is not found
afterwards you simply have to check the HDDRIVER device configuration.
You seem to have disabled the IDE drive's ID and that's why HDDRIVER
doesn't look for this drive when booting.

> Do you just throw it away when you have a problem?

If there are bad sectors, run the sector test. These sectors will be
marked as bad and won't be used by TOS. But, to be honest, it might be
better to throw such a drive away, indeed.

>it. I was told that it might.
>

First of all, it should be 720K, and the disk must be double density, not a HD disk. HD disks cannot reliably be used when formatted to 720K.

If it still doesn't read the disk, then chances are that your ST has a single sided drive (an old 520STF). In that case, it should be able to read PC formatted 360K disks, but your PC's drive might not be able to format 360K disks.

If you're really stuck, you should try a serial connection with a null-modem cable and ghostlink.

This is all in the Quick FAQ.

>I need to get some old doc and txt files converted so I can work on them
>on my PC. Is there a program that will allow my PC to "read" the ST
>disk?

Yes, it's called ST2DOS and a link to it can be found in the Quick FAQ. Not sure if it will work on single sided floppies though.

Good luck,

Cheers,

Nick.

>have. The two are most DEFINITLY compatible!!!

There is only one TOS 2.06. It adapts itself automatically to the available hardware. There was no "STFM TOS 2.06" and "STE TOS 2.06"

Maybe I misunderstood and what you mean is that you have TOS 1.00 or 1.04 on the STFM.

As far as compatibilities go, it should be something like this:

ST, STF, STFM, MegaST: 1.00, 1.02, 1.04, 2.05*, 2.06*
STE : 1.06, 1.62, 2.05, 2.06
MegaSTE : 2.05, 2.06

*with small address change modification
I voluntarily leave out TT and Falcon, which are not compatible.

Cheers,

Nick.

ASCII Text (TXT) files are identical on both systems, and the Atari disk format is also identical to the IBM format EXCEPT that the older Atari ST's didn't format the IBM Boot Sector. The PC requires that the Boot Sector be formatted, which is why its unable to read your Atari-formatted diskettes.

The easiest way to overcome that with your old disks is to get hold of a Public Domain program that will format that Boot Sector. You should be able to get one from most any P/D file library, Atari User Group or Atari dealer.

Assuming your Atari ST has a 720K drive, which it should unless its a really old model which came with a 360K drive, you SHOULD be able to format your DS/DD diskettes on your PC instead of the Atari ST, then use them on both systems.

Sorry for double posting. Been one of those days. The ST crashed while
sending the post and I have lost the file on the rare occasion this has
happened. However I was surprised to see the file actually made it through.
Well somethings go right.

On 3 Mar 1998 17:12:29 , Brian Van Tilborg wrote:
>I have a New Falcon I jsut purchased.
>It has a Conner 80meg Ide and a Syquest 270meg removable scsi.
>The conner was formated as C&D in two 40meg partitions.
>The syquest booted as drive E.
>However the syquest wasn't being address, it could be identified but nothing
>read or written to it.

Clicking on install devices would also show Drive E syquest. But above still
true.

>After reading the hd manual, I figured I could tackle this myself and after
>much thought decided that this was an UNFORMATTED Cartridge.

Unfortuneately this to was incorrect as the cartridge has programs on it and
according to the previous owner, I should have been able to access everything
with the set up it arrived to me in. However I couldn't get the syquest to
read or write, yet HD DRIVER could check the Syquest, so since it detected it
I formatted it. Which is where my troubles began.

>I decided to format it and after reading the manual figured the IDE would
>be left untouched.

Not totally IDIOT PROOF.

>
>I must have screwed something up in setting the partitions.
>I set up two 135meg partitions on the syquest, hopefully as E&F.

I installed the driver onto the IDE drive then Drive C.

>After formatting, I rebooted only to discover the Syquest is C&D, works perfectly
>but the IDE is GONE.
>The IDE boots some atari symbol, acknowledges the conner, does a memory test
>then boots HD driver which seems to boot the Syquest.
>After which there is no conner drive to be found.
But there are TWO SYQUEST PARTITIONS which work.

>There is NO IDE Drive however anywhere.
Which makes removing the driver very difficult.
HD DRIVER will not acknowledge the IDE and the HDDRIVER.sys file cannot be
searched for in the utilities menu cause its on the missing IDE.

>
>If I disable the syquest I STill have no IDE partitions.
No IDE partitions, and obviously hd driver tries to boot the syquest which
isn't there.

>I think somewhere I forget to say there is an IDE as C&D and now I Can't.
I think it may also be putting the install driver on the IDE didn't help.

>I am booting hd driver software from disk now as it was on the conner:-).
Can't seem to boot any drive with the Software on floppy. I can only check
the SCSI with the software utilities. THE IDE does not appear as a selectable
option as it did before this happened.

>1)How can I get the Conner back as C&D.
>2) Have I lost the data on the Conner? I don't think so, however I don't

mE AGAIN,

I just tried them in there and they work so you lot are correct, they DO adapt.

The ROMS i have I bought as an upgrade for my STFM along with a PAL that had to be flattened out and soldered onto the bottom of the 68000. These are legit but as I stated, I thought they were ONLY for the STFM, not the E. All is ok now...thanx...

Brian

STEs never shipped _with_ TOS 2.06 (except Megas), so he doesn't own the
license for it, just for 1.60 or 1.62.

You don't have to replace the old chips, but there are some few Megas
that have either crippled MMUs or motherboards and the additional
sockets won't do you any good.

You are. :^)

>Could someone please tell me where it would be physically located on the >board?

Open it up and look for an empty PLCC (square) socket. There are a
couple of solder pads on traces leading to the Blitter that have to be
soldered to activate it (once you have one).

> Also, the Mega has TOS 1.2, my 1040STFm has 1.4. I assume I can
> transfer the 6 chips into the Mega, but what else do I have to do?

If the Mega has 2 chip TOS (a bank of 6 sockets with every third one
filled), which it should, you can install the 6 chip set by changing the
state of the solder pads that lead to them.

> Thanks,
>
> Tim

I have a Blitter if you want one, but they aren't of that much help,
especially if you use NVDI.

If the driver is booted from disk and doesn't recognize all your drives,
something is wrong with your hardware. The driver file coming in the
AUTO folder (HDDRIVER.PRG) checks every available port and ID for a
connected drive. If something is not detected here, it's either not
present or broken or cables or termination are wrong.

4807. TOS Roms in a Mega ST4

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-05 00:00:00 UTC
From: Tim Curtis <sexsymbol@execpc.com>
Message-ID: <6dlr1i$k9v@newsops.execpc.com>
Source record: 13788

I just replaced the two 1.02 ROMS in my Mega ST4 with the six 1.04 EPROMS from my dying 1040STf by following directions I found on the net. I moved the two resistors on W2 and W3 to pins 1 and 2 and added 0 ohm resistor to W4 as I was instructed.

I put the machine back together and everything seems to work fine. However a few hours later I remembered that the instructions also said to remove the chip at U12 and I forgot to do that. Like I said, everything seems to be working fine.

Should I open up again and remove the chip? I want to confirm that this is indeed the right thing to do.

Also, anyone know how much it would cost to add a Blitter chip to my Mega? Any good sources?

Thanks,

Tim

Is the Supercharger documented to run with a Falcon? I currently have an AT-Speed in my 2.5meg ST, which I use enough to be concerned about my alternatives if I get hold of a Falcon. I know that there are probably some Falcon Speed boards floating about (maybe more than there are Superchargers), but something that doesn't involve mucking around under the hood is an appealing idea.

Probably a silly question:
Is this independent from the ATARI machine ?
Can I use a Link II with my ATARI Mega 2 or the 1040 STF and
link more than 3 devices to it ?

Hi Folks,

I have tried to phone the company icd (www.icd.com)
to by an SCSI adapter for Mega ST. Yet, nobody responds
(although an answering mashine is there). Also email is
ignored. Does the company still exists?

Anyway, does somebody have a spare SCSI-adapter for
Mega ST for sale?

Thanks,
Artur

Hi, I have some Atari stuff for sale.

Atari 1040STf for $60.00
Atari SC1224 Color Monitor for $40.00
Marcus Trackball (RB2-114) for $10.00

Or all three for $90.00

Please contact me at maxdaisy@<nospam>arn.net. (without the <nospam>)

Thanks,
Steve Brown

4813. Programming the Atari 2600 with an Atari ST

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-05 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <6dn6vn$id3@james.hwcn.org>
Source record: 13794

No doubt many of you Atari ST enthusiast remember the old Atari 2600 VCS. If you're like me it was probably the first video game system you ever had.

I may suprise some of you to know that there are still people out there who collect for and play these old machines and it may suprise some of you even more that there are people who actually write new programmes for this machine (even producing them on cartridges, of course they're Eprom based instead of Rom).

The easiest method to write new games for the Atari 2600 is to use the Starpath Supercharger. It's a device that plugged into the cartridge port of the Atari 2600 and then had a plug that went into a cassette deck.

Currently there are Atari 2600 development platforms on almost every computer except, ironically enough, the Atari computers.

You can find 2600 development tools for:

The C-64 (Playbin.prg - a programme that takes binary files and turns them into audio for the Supercharger Tapes)

The Apple][(This was the machine used to originally develope Supercharger games for the 2600. As with the C-64, the bulk of the work is just done with whatever 6502 assembler you like. But with the Apple][, no special programme was needed to save the programme to cassette tape since the Supercharger uses the same tape format as the Apple][)

The Amiga (Distella - a programme that disassembles 2600 BINary files
DASM - a 6502 assembler
Make Wav - a programme that turns 2600 BINs into WAVs to be played to the Supercharger
Cheetah - similar to Make Wav, but allows you to enter game codes before playing.)

The Macintosh (Bin2tape - A programme that turns 2600 BINs into WAVs for playing into the Supercharger)

The PC (Distella, DASM, Make Wav, Cheetah and
Win PlayBin - a programme that turns 2600 BINs directly into audio to be played into a Superchrager through your sound card, or recorded onto cassette tape)

I've been using my PC to develope new games for the old Atari 2600 and have no complaints about the development system, but it just strikes me as odd that there isn't a development system for at least one

Atari computer. The development tools for the 2600 are all public domain and the source codes for many of them are available on Bob Colbert's Atari 2600 programming webpage.

http://www.novia.net/~rcolbert/

Bob wrote or ported many of the PC and Amiga development tools. And is currently working on a visual 2600 development system for Windows 95.

Anyways, I was wondering if there happened to be any ambitious Atari ST programmers here who would also like to write games for the Atari 2600 (It's a 6507 processor, almost the same as a 6502. It's also an extremely challenging machine to write for) and would be interested in porting the development tools over to the Atari ST platform.

One of the biggest advantages the PC and Mac 2600 developers have is working Atari 2600 emulators on their machines. But a 2600 emulator would likely be beyond the capabilities of any of the atari machines.

If you're interested in learning to programme the Atari 2600 there are two mailing lists...

stella@biglist.com (an Atari 2600 only programming E-mail List)
gametech@rbkc.gov.uk (an E-mail list for programming all classic machines)

and two newsgroups

rec.games.video.classic
alt.atari.2600.programming (this is a new group)

I hope there are some Atari ST users/programmers out there who also have an interest in developing new games for the old Atari 2600.

My favorite solution to the Falcon second floppy drive problem is a Floptical drive, though they work best with "standard" floppy formats, i.e. not 800K and 1.6M, though I really haven't tried to format a 1.6 on my TT and read it on the Floptical.

I concur. If you ever actually _used_ MS Write and got any kind of
decent output, you're a far better man than I. Write was way worse than
worthless (damn! what's a synonym for than that starts with w?). Even

Word Writer would be better, though WordUp is a good replacement.
Personally, I would go with a cheap copy of Calamus 1.09n or Pagestream.
They're overkill, but they're cheap!

Why Gates would ever think that users of computers with a Digital
Research based OS would use an MS product is beyond me...

On 4 Mar 1998 16:47:23 , Brian Van Tilborg wrote:
<much snipped>

This bit of info may be correct, Uwe can (please) tell you if it's wrong,
but this should help.

The following depends on the verion of HD Driver you're using, and this is
taken from the v7 manual. It also depends on the SCSI ID of the syquest,
which you can find with the ID check of that version, or on the back of
the drive, if the ID selector is hidden there. In any case, replace the 0
with the correct ID.

First of all, install the driver on the Syquest C: Then select the
Partition Assignment (Option menu) and select SCSI 0: as C: and IDE 0: as
E: Then select Device Configuration (Option menu) and enable I0 and S0,
or you can use the Auto Configuration to do this.

After that, a reboot should then give you C: and D: on the Syquest, and E:
and F: on the IDE.

ICD didn't answer my e-mail when I inquired about upgrading to ICD Pro 7.0. That was enough to tell me that they didn't want my business again. Instead, in a case of serendipity, I ended up buying HDDriver from Systems for Tomorrow (SFT).

>Anyway, does somebody have a spare SCSI-adapter for
>Mega ST for sale?

SFT has the Link '97 SCSI adapter for $89.99. And they have the latest version of HDDriver, which is faster than the ICD 6.0.8 I was using. And they answer their e-mail... other dealers will, too.

Dan,

> Why Gates would ever think that users of computers
> with a Digital Research based OS would use an MS
> product is beyond me...

The problem wasn't that Microsoft Write (or more commonly known as "Microsoft Wrong") was a MS product --- the problem was that its was BAD software (even by Microsoft standards). About the only way that Atari could help promote it was to give it away for free by bundling it with its systems in the late 80's.

As an Atari dealer, I found it much less aggrevating to REMOVE it, throw it in the trash can and substitute Word Writer in the bundle before delivering new systems to buyers. There's nothing worse than delivering a new Atari system to a customer and then having to try to explain why he or she couldn't get the bundled software to work properly and have face needless hours of total frustration.

Atarians didn't buy their systems to have to face that kind of aggrevation. We EXPECT our systems and software to install and work easily and properly WITHOUT having to read exhaustive manuals, 'made-easy' books, or undergo hours of needless frustration.

Most ANYTHING would be a better choice for word processing than Microsoft Wrong!

Unless of course he actually did buy tos 2.06 for his last computer (I think he said it was a STfm, but that really doesn't matter), does it? I think it's legal to make a copy of the code to other chips, as long as he doesn't use them at the same time.

>>>Yes, the Marpet Xtra-RAM (or whatever...) Deluxe will work fine.

>>There is also the Magnum-ST card, which allows to add about 10Mb of alternate RAM to the existing ST-RAM.

The Magnum -ST card IIRC will only work with the Mega STe not the Mega ST. It adds 8 megs of fast ram to the system in addition to the 4 meg on the Mega totaling a max of 12 megs. Your best bet is going with the X-tra ram board. It is a quick and simple installation. If you feel up to it (if it were me I would just add the 2 megs of DRAM to the motherboard and a couple of 33 ohm resistors for the cas lines), and bingo you got a 4 meg unit. Get a hold of Brad at Best Electronics in San Jose, Ca. He carries everything that you might ever want for your machine. Good Luck!

>>You don't have to replace the old chips, but there are some few Megas that have either crippled MMUs or motherboards and the additional sockets won't do you any good.

Come on....CRIPPLED MMU's ?????? How about it was Atari getting cheap!!!!!!!!! Actually there were a few MMU's that could only handle a meg of memory. (Mega ST1) They were actually designed this way. They were not crippled. Off the top of my head I don't remember the part number. There is a FAQ that describes these MMU's and what you need to do if you have a system with one of these. To replace the MMU will cost you about $40.00 for the new part.

>
>If the Mega has 2 chip TOS (a bank of 6 sockets with every third one filled), which it should, you can install the 6 chip set by changing the state of the solder pads that lead to them.
>
I have a few docs that explain and have pictures of the different layouts to change TOS. There is an additional IC that must be installed if missing on the motherboard. If you would like the docs to do this job, drop me e-mail and I will mail them back to you. I also have them as a PageStream document.

>> Is there a way to convert ST doc files and/or txt files my PC. The PC
won't read an Atari formatted disk and the ST won't read a PC formatted disk.
I formatted a disk on the PC for 728k, but the ST doesn't read it. I was told
that it might.

The St will and can read 720K formatted disk. If you have TOS 1.04 or above.
You can also find a file called PC format that will write the IBM boot sectors
on the disk from the Atari. You need to make sure that you use a DDDS floppie
only HD disks will not work on most units

Get ahold of Best Electronics in San Jose, Ca. He carries everything that you might want or need for your Atari.

>
> Tim, AFAIK the Mega ST's have Blitter chips built-in standard. At least, mine does! ;-)

Some of the early modles of the ST were shipped without the blittler chip. These units will have the pad, but no socket. You need to unsolder the pad and add the socket and strap a couple of pads to let the system know that there is a blitter attached. Good Luck !

Forgett the blitterchip and get nvdi! If you plan to spend your mega tt-ram
or alternate-ram you'll see nothing and the most important thing is that nvdi
is much faster!

4835. Help improving STinG Performance

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-07 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <6dq2ma$gi2@news.Hawaii.Edu>
Source record: 13720
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings,

I have recently installed the latest STinG package, including HSMODEM7, the new STinG modules, serial CPX, etc... On my 48mhz TT, I am getting terrible network performance, about 1/6th of the speed of a Zmodem transfer of the same file. A 100k file takes 20 seconds with Stalker/Zmodem while it takes over 120 seconds with STinG and MGftp. I expected some performance degradation due the the networking code, but this seems excessive. I will be testing a faster modem today, but I assume that it will still perform much below capacity.

I have experimented with different buffer size settings in HSMODEM, as well as networking settings (for MSS, MTU, RWIN, etc...) - nothing seems to make much of a difference.

Does anyone have any recommendations? I have to believe that this is all due to some configuration problem, and would greatly appreciate some help.

Thanks!

Aloha,
John Perez - jperez@hawaii.edu

I have only had this system for a few days, so I am going over things in
retrospect so that I can communicate with you now that it is working.

HD DRiver 5.1 booted both drives from the floppy.
HD DRiver 6.0 would see the Syquest and not the IDE when booting from floppy.
IF left to boot off IDE, the Syquest would boot and IDE would shut off.

After booting with 5.1, I tried to deinstall .sys file or locate .sys .
It sent an error message about the SYS file. This is because the file was
a version 6. sys. and I was using the 5.1 utilities. Version 6 of hd driver
would not recognise the IDE anywhere, in options, anywhere, even after booting
both drives with 5.1 . So I Went back to 5.1 looked in options, and the IDE
selection was available. The drive still showed DEselected in so I selected it
and after this point, All versions of HD driver worked and the harddrive boots
normally from floppy or hard disk with version 6.

Regardless if this makes sense to you, the trick was getting to be able to
turn the IDE back on as you suggested and I achieved just that.

I have two packages.
HD DRIVER 5.1 with complete manual.
HD Driver 6.0 UPGRADE PACKAGE, with complete manual.
Would this make a difference with regard to booting?

Anyways, I now have IDE as C&D and Squest 270 removable as E&F.
Of all the manuals I have, I don't have the syquest.
I have discovered that either scsi connector seems to identify the drive, and
that there doesn't seem to be a specific IN/OUT for other devices. IS one of these
a terminating port as you ask me?

Almost Finally, (as if I haven't asked enough:-) If I can read and write to
the newly formatted syquest, why can't I read the 2nd removable cartridge that
came with this machine and is loaded with software? I am probably going to
format it too, I am just in no rush to make a mistake again:-).

Lastly, These packages were purchased at either TOAD or Systems for Tommorrow
(I think the latter I will have to look again), are upgrades transferrable

between new purchaser?

Thank You.

Well I was thinking along the lines of something even simpler than that such
as having a file in the autofolder that acts up with no bootmanger to deselect it
or say a corrupted file that won't delete. I usually back up then format and
reinstall everything.

But yes if there were bad sectors, I too would throw it away.

HARDWARE (no manuals or software)

1.1040STf 1MB ram. TOS 1.4 This machine has an audio output jack (RCA female) so you
can plug in to your external amplifier. Listen to the robot voice or your games loud!! No need for a
pre-amp. Will go with its famous BEETLE mouse!. $65

2. 1040STf TOS 1.0 1 MB RAM No mouse. $ 35. Runs great.

2. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari or pc. $25.
(has original PC software)

5. SC 1224 color monitor. It needs detachable video cable $16 (I can give you one that needs
a connector at the other end (free).

6 . 5. SC 1224 color monitor. with non detachable video cable and power cable. works great. $25

SOFTWARE:

1. TRUE PAINT V 1.02 $15 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B/W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $15 (Falcon).
Needs Multitos.

All OBO. Questions welcomed. If interested send ZIP code to ask UPS for charges.. For software I can send it for $3.00 US. (If you are in the US; I am willing to send abroad also). Phil.

There was a good article on Atari's history in one of the mainstream computer magazines a year or so ago that talked about that fact in more detail (sorry, I can't remember which magazine it was, but I probably still have a copy of it at the office somewhere if anyone's interested). From what I remember, Microsoft couldn't produce a Windows OS within the timeframe Atari required for introduction of the ST. Microsoft wanted a year or so for development, while GEM was essentially ready to go. And, at that time, the Tramiels were anxious to produce a new system to help revive the company they had just taken over and take it back from the ashes of its former glory.

You may be able to use a SCSI CD ROM if there is a SCSI out connector on
that host adaptor.

When you run the install program, it asks you what language you want. If
the software package is still complete, you should be able to just run
install again. If I recall correctly, there was a bug with the paths on
the install program, so you might have to experiment if it won't install
the first try.

The 520STFM had one bank soldered in and one bank empty as the same
motherboard served both the 520 and 1040 models. If you have the second
bank socketed, then it has been aftermarket upgraded to the 1040
configuration. See the FAQ for hacks above 1MB. There are also
commercial ram kits.

I don't see what problem a VDI would have with multiple display devices,
in principle (some implementations may of course have limitations). It's
not really any different from printer drivers or off screen bitmaps.
Just open a workstation for each screen and draw on whichever you choose.

Naturally, it wouldn't be possible for the VDI to deal with windows
that span two screen, but I'd say that's a job for the AES/application.

>> switching resolutions.

I haven't checked what the standard VDI does at a resolution change, but in
fVDI every single drawing operation gets its resolution data from the
correct physical workstation. As long as that workstation is kept up to
date, everything should work fine.
(The current fVDI can't deal with any mode change at all, however.)

>Ehuummm.. I was actaully thinking about this. As Johan Klockars is
>making a
>new VDI, fVDI, why not put in support for this as well?

fVDI will definitely be able to handle drawing multiple workstations with
varying resolutions and graphics modes. It doesn't matter if those are
off screen bitmaps or in memory that's mapped to a screen.

Just do it with fVDI instead. ;-)
I'll make a small device driver example available with the next release.

The current monochrome driver supposedly works well on a NOVA card and
it took me about 30 minutes to create a minimal chunky 8 bit (NOVA) driver
that also worked (slow and without line drawing (lack of non-accelerated
support for that in v0.80)).

Please someone help me... I just fell into an Atari CDAR 504 and it refuses to work. All I get is an E2, E3, or E4 on the track screen and then the drive locks up. Does anyone know how to repair this piece or have schematics.... I cannot even get it to play music CD's. Copies of the Owners manual would be appreciated also.

Hi Harold! Boy, you've got an "oldie" there. <smile> I would definitely
try Brad at Best Electronics for parts/info... (its said that Atari used
to go to him for hard to find parts before they closed down!) <grin>

No, there's a version of this board for _both_ the Ste _and_ the STFM.

I have a total of 12Mb in my STFM right now; not a Mega I know but it's
largely the same computer in a different case - unless you know differently!
:-))

>adds 8 megs of fast ram to the system in addition to the 4 meg on the Mega
>totaling a max of 12 megs. Your best bet is going with the X-tra ram board. It

If you're happy with 4Mb max, that's fine. You can always add to it with the
Magnum board later (also read my review in Atari Computing)

Source record: 13740

Thanks for the input. I discovered, much to my dismay, that I do indeed have only 360k disk drives. However, I did locate a program that will allow my PC to read them. I now have the files on my PC hardrive. The only remaining problem is to convert from Atari 1st Word WP format to ascii. For that, I've been told of a program called Pacifest, which will allow a PC to run an ST prgram. If I could run 1st Word on the PC, I could more easily convert the files. Unless there's some way to do a global command that would change the entire group in one swoop. Is that possible?

Thanks for the help, to all who responded.

Out of the ether, the following was mentioned by joska@nuts.edu...:

j> Most definelately not, I have MiNTOS (including MiNTnet) on my
j> AB/Falcon and it's extremely stable. I think you should have a look
j> at what else you have installed (e.g. running HS-Modem after MiNT
j> can cause problems).
Right, well what happens is if I try to use the latest Freemint I can find,
then the machine has a tendancy to crash when booting with an AES
replacement. But if I run with an older version of Mint (I think its 1.12)
then the machine runs just fine.

If I take the same setup which crashes on my falcon/AB040 and run it on my TT
then it works just fine.

Steve the PC monitor MUST synch down to 15.74 Khz Horizontal on these machines. Almost all new monitors won't synch below 30 Khz horizontal. The current exception being the large combination TV/VGA monitors. You may be able to find an older [more than 5 years old] multi-sync monitor that does this. You will also need a multi-sync switch to convert the 13 pin DIN plug to 9 pin VGA . I don't know of a converter box that switches to 15 pin SVGA.
I hope this helps.

With the tools coming with HDDRIVER you can create such a partition.
Note, however, that partitions > 1 GByte are not officially supported by
TOS. This is why I recommend not to create partitions > 1 GByte.

PaCifiST is an emulator, it will make the PC run just like an ST.

There will be no advantage of running 1st word on the PC. You might as well
just run it on the ST and save your files as plain ASCII onto your floppy
disks, that you will then transfer over to the PC. It will be exactly the same
without going through installing PaCifiST.

Cheers,

Nick.

Well, you need another computer, or at least another drive, and you can
either :
- Replace the drive in any another computer that works fine with your drive
and try to format/write/read a disk. If your drive works fine, than it's
clearly not out of order and the problem must be in the controller...
- Replace your drive with any other drive from another computer that works
OK and format/read/write a disk. If it's OK, than the problem must be in
your drive.

You should do those both checks, since your drive AND your controller may
both be out of order...

It doesn't quite matter whether the other drive is 720Kb or 1,44Mb, but if
the other computer is a PC, don't forget its bios setup when installing your
720Kb ST drive into it.

Be careful with PC drives, since they're usually all set as drive 0 (or is
it drive 1 ?) and ignore the other DS1/, DS2/... signals. Examine the PC
drive and look for a drive number selector : note its actual position, set
it correctly for your ST, and don't forget to set it back to its former
position when finished. A ST drive must be configured for DS0/ if it's drive
0 (A:) and DS1/ if it's drive 1 (B:)

Et pour terminer, essaie d'&#65533;crire en Anglais dans les groupes de discussions
internationaux (dont le nom ne commence pas par FR.). Et si tu ne ma&#65533;trises
pas l'Anglais, limite-toi au groupe fran&#65533;ais FR.COMP.SYS.ATARI.
(And as a conclusion, try to write in english when using internationals
usegroups (names not starting with FR.). If you don't speak english, you
should use the newsgroup FR.COMP.SYS.ATARI.)

Okay, Software Hut (yes, they are an Amiga dealer but...) sells 2 models
of the same multisynch monitor that will synch down to 15 khz. One is a
14" inch model that includes speaker for around $379 (IIRC), and a huge
17" model that costs $679. I've got the 17" model on my Falcon 030, and
it works fine, even "learning" new screen modes as the Falcon throws them
at it, so that the next time I run a RGB game or demo it knows what res.
'n stuff to switch to... Hope this helps! ;-)

(With the correct switchbox, both these models -should- work with the
older ST/STe's...)

4867. Falcon floppy drive in a PC?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-09 00:00:00 UTC
From: pd213@cam.ac.uk
Message-ID: <6e1cok$55f$1@lyra.csx.cam.ac.uk>
Source record: 13654

Is it possible to use a floppy drive originally from a falcon inside a PC?

I tried connecting it up (with the cable the right way round!), but it
didn't work properly.
The drive would spin, but wouldn't actually read anything.
I thought it might be something to do with the jumpers, but I have no idea
what they are for.

The drive is made by Epson but I can't remember the model number. They
don't have anything on the web site either.

Any ideas?

Hi Hallvard.
I once made a Midinet between a STFM and a Falcon, using the pinouts
from the usermanual. It works OK for me, even it was slow.
Don`t know if it works for you?

4871. Nemesis difficulty

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-09 00:00:00 UTC
From: John Kolak <jkolak@jps.net>
Message-ID: <3504E0C7.392B5A12@jps.net>
Source record: 13658

Hi,

I am in the middle of installing Nemesis, and am having trouble with it. I was hoping someone might be able to help.

I have installed the buffer and performed all the tests with everything okay up to page 17 in the manual. In starting the Nemesis installation with the Keyboard and MIDI patches, the machine fails to run properly at the boot up directed on page 22. The manual gives two options for failure: A persistent black screen, or the machine boots normally, but the mouse and keyboard are not responding properly. Neither description quite fits what is happening.

The machine does best on a cold boot up after the it has been left alone quite a long time, such as coming back to it for the first time the next day. After being on a minute or two, the behavior becomes worse and worse.First it will boot up all the way to the desktop. Once the mouse even worked right on the desktop, but usually the cursor will fly wildly across the screen when the mouse is moved. Then red lines will start to streak across the screen horizontally, becoming more numerous until the screen is quite full of them.

Then rebooting, the screen won't make it to the desktop again, but the boot process will stop on the desk manager (boot manager). Next time it won't make it to the desk manager, but will hang up on the memory test. Next time it won't even make it to the memory test, but will stop after the Fuji logo is displayed. Then the Fuji will start to break up, spreading apart vertically, and ghosts of it appearing to the right side of the screen. Other times that the boot sequence has started to display, it will hang up there, and that text will also break up and spread vertically. Other times colored vertical bars will flash to the right of the center of the screen. Interference seems to be the prime suspect, as when I move the yellow and gray wires attached to L102, the picture will either get worse in spreading out, or stabilize if I hold the wire just right. But even if the picture restores, the boot process still will not resume once it has stopped. I suspected damage to the keyboard chip due to the non-response from the keyboard and bizarre behavior of the mouse, but the manual suggests reversing the installation, and when I do that everything works okay again.

I've about decided my Falcon cannot take a Nemesis. I tried all the troubleshooting tips on additional grounds as suggested on pages 18,19,34, and 35. The only thing I haven't done is shorten the wires to minimum since the manual is somewhat contradictory in that it states that wires may have to be kept away from the memory card or CPU, and yet also asks for the wires to be short. If the wires are cut to absolute

minimum length, then there is no room for moving the wires to different routes, or moving the Nemesis card to different locations.

After reading page 34, "With so many differences in the Falcon it is impossible to say how each installation affects the various ones that exist," I am about to decide that my Falcon is one that cannot accept the Nemesis.

Any ideas?

Thanks,

-- John

>is indeed the right thing to do.

It definitely is - you now have two outputs shorted together (one from the 74LS11 and one from the MMU), which is a bad thing - it may damage one or both chips, or may lead to instable operation.

You don't need to remove the whole chip - cutting pin 12 is enough (but don't cut it directly at the case, so that you can re-attach it later if necessary. I just had to replace such a chip for this reason (I needed 6 ROMs for testing), and de-soldering it is no fun due to the large copper areas around).

You should go to Petr Stehlik's homepage, he has compiled a special
AB-version fo the MiNT-kernel. I'm using it right now (1.14.5 or
1.14.6) and I have never experienced any problems with it.

There is no need for special IN or OUT ports. With SCSI all ports are
the same. Simply connect an external terminator to the last device (i.
e. the last unconnected port in your SCSI chain).

> Almost Finally, (as if I haven't asked enough:-) If I can read and write to

Hi

Saw the replies and noted no mention of "Edhack" which can be both an accessory and Program. Good old Word Writer St, St Writer, St writer Elete 1ST Word & 1ST Word +

Though Pagestream is great; as a word processor it is clumsy, as is WordUP, Calamus etc (there are others) these are for desktop publishing

Word Writer has both Dictionary & Thesaurus capability is O L D came out when the 1st ST's did but for simplistic writing is fine.

Has anyone checked with Toad to see if they have something good.

Edhack is by far the nicest little editor/word processor

>4 OUT transmit data 4 IN receive data
>5 OUT loop return 5 IN loop return
>
>It seems a bit odd to me that there are no Ground connection pins on the
>MIDI IN connector....

There is!
"loop return" should be read as "ground".
"ground" should be read as "shield".

Even if the shield is connected to the ground somewhere, these 2 kinds of pins
do not play the same role, from an electronic system point of view. Sorry,
I am too lazy to explain the difference here! ;-)

Cheers.

As I understand it, he hasn't installed the Nemesis board itself yet, so the problem is not frequency related I'm afraid.

John, make sure the pins of the ACIA chips are properly cut and soldered.

Take care,
Daniel

It's an ACSI to SCSI host adaptor.

p> So, the consequence is that you can only connect ONE drive
p> (configured as device 0) to the adapter, and only if the drive can be
p> configured to ignore parity. In your case, you must use another
p> adapter.

This is not true in all respects. The Atari host adaptor that fits inside the Mega STe is a peculiar device. As you say, every device connected to it must be set up as SCSI ID 0, but the dip switches on the HA board allow it to be reconfigured to be seen as an alternative SCSI ID number, but only between 0 and 3. In this way, it's possible to connect a seperate ACSI host adaptor to the external connector and have an external drive as the boot drive, with the internal as a subsequent drive - useful if you've got a much faster external unit or you want to move data from an ST setup using the existing paths. I've done this successfully, even using non-sequential SCSI ID numbers on the internal and external drives.

I said it was peculiar...

Moreover, it *is* possible to chain a second drive to the internal Atari host adaptor - given that the rather weak power supply in the MSTe is up to it. I've got details in a text file somewhere of how it's done if you're interested, though of course you'll have to find somewhere to actually place a second drive and get power to it...

p> I can recommend the LINK96 (WB Systemtechnik, Germany), specifically
p> made to be hooked internally into the MegaSTE (simple replacement of
p> the original adapter). Together with HDDriver, it is a perfect setup.
p> I am using it in my MegaSTE with an internal 1GB and an external

p> Syquest, and it is beautiful.

Of course, this would be a much simpler solution using a much more capable host adaptor. But we shouldn't make things too easy, now should we? B^{)

Considering Hasbro's success with the Frogger remake (as lousy
as it was, it did sell), I bet Hasbro is just chomping at the bit to
re-release some of Atari's back catalog in anticipation of similar
success. Somehow I doubt Hasbro will do anything with the hardware, but
who knows. Maybe they will incorporate it into some kind of toy, like
a Pico-style device.

Not necessarily, the agreement merely spells out that Hasbro gets all
the
assets of Atari, from video games to computers. It doesn't mean Hasbro
is
going to release computers, just says they now own all the
rights/patents/etc.
to the computer line.

Essentially, JTS is transferring everything under the Atari label to
Hasbro.

That's ancient ! IIRC it hasn't even got CAB 1.5, but an earlier version !

You're much better off if you look for more modern versions of the components.

Cheers Peter

4890. Atari Monitor...Help!

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-11 00:00:00 UTC
From: KevinManne@wycol.com
Message-ID: <6e7o93lpa1@nnrp1.dejanews.com>
Source record: 13551

I have an Atari SC1224 monitor which I was hoping to use with my Jaguar since I got a
Catbox from an eBay auction recently. Well, I got the Catbox and hooked it up, but the
monitor has a serious case of "the rolls". Can anyone give me a suggestion on how to
remedy this? Where could I send it to be repaired (if such a place exists)? And lastly,
does anyone have an SC1224 or SC1435 (I think that's the right #) for sale?

Thanks,
-Kevin
KevinManne@wycol.com
jaguar.holyoak.com

P.S. I've spent HOURS trying to get the V and H hold set correctly, and that didn't work.
It's the Goldstar model, if that matters.

Atari does NOT have an arcade division. It's a long story, but the end
result of it all is that Atari Games, the arcade game maker, is now a
division of Williams (maker of Defender, Sinistar, etc...).

As for a new Atari console... I wonder if Hasbro is a Project X
licensee?

Not really. Consider the staggering number of patents and licenses involved. Hell, just look at those "key marks" that are mentioned - the Atari name, Fuji logo, Centipede, Crystal Castles, Yar's Revenge, and so on, and so on! That alon is worth a ton of bucks. (Well, to me anyway!)

4893. Mega STE HD dip switch help

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-11 00:00:00 UTC
From: hsideras@mettav.demon.co.R.E.M.O.V.E.T.O.R.E.P.L.Y.uk
Message-ID: <31367_hsideras@mettav.demon.co.R.E.M.O.V.E.T.O.R.E.P.L.Y.uk>
Source record: 13671

Hi Anthony, on 21 Feb 98 you wrote: ...respect, brethren
A>
A> Can someone tell me the function of the 3 contact DIP switch on the
A> internal HD interface card in my Mega STE? It's on the back edge of
A> the interface card.

I mentioned it was possible in my last message, but I've scoured my hard drive text files and the specific EMail I had is nowhere to be found. I think I must've lost it during my drive problems of last year.

Instead, I've found something related which may answer your question -kudos to Michael Ruge...

----------cut here----------Modifying of the Atari hostadaptors in the MegaSTE and the STACY
(Copyright 01-05-1995 Michael Ruge - 65428 R&#65533;sselsheim)

(Translation 07-10-1995 Frank Szymanski - 45889 Gelsenkirchen)

The hostadaptor in the MegaSTE and STACY is only able to use one harddisc with unit number SCSI 0 without parity. With this little modification the hostadaptor (fully Atari-compatible) is able to address two harddiscs (compatible to the Megafile 44 hostadaptor, which means that you can use the regular harddiscdriver!).

All you have to do is to add two wires and a 1 KOhm resistor!
The one wire goes from chip U4 pin 12 to chip U8 pin 1, the other from chip U8 pin 2 to pin 44 of the seconds (the new one!) harddisc SCSI cable.
Both harddiscs are connected to the same SCSI cable (therefore you have to squeeze a second 50 pin liner onto it) and the second harddisc has to be jumpered onto SCSI ID 0 (yes, you are right: both harddiscs have ID 0!). Cut the SCSI-cable between the first and the second harddisc, only and exclusive at pin 44 (directly behind the 50 pin wide socket of the first harddisc is recommended). Now the second wire from chip U8 pin 2 has to be soldered at this vein (to the vein which goes to harddisc no. 2)! After you have done this, solder the 1 kiloohm resistor from pin 1 of the resistorarray RP3 (pin 1 is the one which points to the inscription REV. 2 or REV. 3) to pin 2 of chip U8.

Now you need a Y-cable for the harddiscs voltage and to put the computer into operation with the two harddiscs. If necessary you must reconfigure your harddiscdriver so it can find the new harddisc on system-bootup (Please refer to the drivers documentation).

Beware: The hostadaptor has only been built for short SCSI cables! The cable should never (!!!) be any longer than 20 centimetres/7.8 Inch. For larger

cablelengths there is another termination used than the hostadaptor has (impossible to change!). On the other hand you only need short cablelengths in the MegaSTE and the STACY (particularly in the STACY there is only room for one harddisc when you also want to use the discdrive) and even when you use a caddy 20 centimetres/7.8 Inch are more than enough! Furtheron NONE of the harddiscs is allowed to be terminated, so FUNDAMENTALLY remove the ending terminators otherwise the drivers on the hostadaptor were overloaded and may disappear in a cloud of smoke (no joke!).

In the end: The device adresses:

dip 1 dip 2 dip 3 --------- dip-switches on the hostadaptor

on on on only ACSI-unit 0 (Atari default)

off on on ACSI-unit 0 for the old harddisc
ACSI-unit 1 for the new harddisc

off off on ACSI-unit 1 for the old harddisc
ACSI-unit 2 for the new harddisc

off on off ACSI-unit 2 for the old harddisc
ACSI-unit 3 for the new harddisc

off off off ACSI-unit 3 for the old harddisc
ACSI-unit 4 for the new harddisc

LIABILITY

I, Michael Ruge, (me, Frank Szymanski, too) cannot accept liability for direct or indirect damage in financial, material or any other way which are caused by the use of these instructions.

These instructions were produced and tested with the highest care.

I cannot estimate how this list, instructions or modifying of your computer corresponds to your abilities. The person who carries out the above mentioned modifications always bears responsibility. In case of doubt let a friend or even your computer dealer do the modifications. I cannot take responsibility for irregular done works (e.g. computer is out of order) because I cannot verify if your abilities corresponds to the demands to do the modifications in a correct way.

This is especially true when you work with voltage or currents
Electrotechnical laymen have to

STAY AWAY

from voltages higher than direct voltage 120 volts or alternating voltage 50 volts (in Germany!). In other County's/Country's take a look at the law of order for electrical units and regulations.

Electrotechnical laymen are all persons, who did not get equivalent instructions or who do not have an electrotechnical education.

hint: these instructions can be found seperately under `MEGAE_HA.TOS` on
bulletin board systems (german version only).

And actually a very good one.

When I originally bought the Matrix CoCo card from System Solutions, Rob Perry was showing me around the accompanying software (CXXSETUP and SLCT_DEV) and told me that when he was programming an application and running MON he would get the application running through the graphics card with the debug info appearing on a simultaneously connected SM124.

Not being a programmer I wasn't motivated to follow this up, but it's certainly possible from what he said...

at> substantial money to upgrade it. For me $30US is about as much as
at> the ST is worth.

First, STGuide is up to v1.5e andsignificantly improved.

Second, I think this behaviour is primarily associated with not being able to
find an STGUIDE.INF file in the same directory as the PRG/ACC rather than any
conflict with GDOS. That's not to say that it *isn't* a problem with an
early TOS, but that's not a problem that I'd been aware of.

Glad you're sorted anyway...

4899. a few HW - Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-11 00:00:00 UTC
From: Ingo Farcher <IFarcher@orion.hyperwave.com>
Message-ID: <35064250.69C33B8F@orion.hyperwave.com>
Source record: 13677

Last week, i got a Mega-ST from a friend that switched to PC.
He had been using the Mega only for wordprocessing and thus it is in its original state with 1FD (DD) and 1MB Ram.

Now i've been digging myself through this Group searching for information how to connect a HD and i'm a little confused about all the different Terms that have been used (besides all that ST.. STE ..520ST etc).
I'd simply like to know if i can connect a HD to the internal ACSI-connector (the only large connector inside my Mega-ST, i think ??) _without_ any modification to drive or computer
or do i have to by a ACSI to SCSI-converter?

Is it true that the HD must not be terminated (first time i hear of an unterminated SCSI-Bus ?!?)?

Can I expand the Memory of the Atari in an easy way (I think: no; I couldn't find any socket-like device on the Mainboard).

In a WWW-FAQ-Doc I read, there was explained, that connecting a parallel ZIP-Drive has to fail because of the lack of some signals on the parallel port. Now i found that there are some solutions for connecting Ataris via Lap-Link cables. How can that work, if there are not enough signals for a parallel transfer into the Atari? ZIPs usually work (slow) on old PCs without bidir parallel ports.

I'm a complete greenhorn in Atari-HW so please excuse some possibly obsolete questions and thanks in advance !!!

Ingo

Forget the www130 package, it's old and no longer maintained. STiK is old, and
does not support PPP, which is required bu 99% of ISPs nowadays.

You need to get the various programs separately,

STiNG (STiK replacement, TCP/IP stack and dialer)
http://www.stud.uni-hannover.de/~perot/index_e.html

CAB 1.5 (freeware)
CAB 2.x (commercial)
http://www.student.informatik.th-darmstadt.de/~aclauss/download_e.html

CAB Overlay (goes in the same folder as CAB)
http://www.netset.com/~baldrick/

Newsie (email and news client)
http://www.primenet.com/~rojewski/newsie.html

Antmail (email client)
http://www.netset.com/~baldrick/

HSModem (strongly recommended improved serial port driver)
http://www.flinny.demon.co.uk/download.htm

There are also other solutions, that are not based on a STiK/STiNG TCP/IP
stack.

WENsuite
http://wwwusers.imaginet.fr/~oxo/

Draconis
http://dc2.uni-bielefeld.de/atari/edracon.htm

No need for a FAQ really, just read the docs that come with the packages. You
can also check out the following link to find out more:
http://www.geocities.com/SiliconValley/Bay/8745/atari_internet.html

This should keep you busy for a while ;-)

Cheers,

Nick.

Now that you talk about it, I seem to remember hearing about a debugging
package that used a french Minitel screen (the little free terminals that we
have over here, the pride of France Telecom that run at 1200bps, and the
reason the net is underdeveloped in France). It used a standard Minitel
cable (also used for dowloading stuff from BBS) between the ST serial and the
Minitel.

Well, that was a long time ago. I can't remember more.

Cheers,

Nick.

The internal connector is a MegaBus, basically a processor direct slot. It has nothing to do with ACSI. The ACSI connector or DMA connector is on the back of the Mega.

To connect a SCSI drive you need either an ACSI to SCSI host adapter with an external HD (with PSU, case, etc...), or an internal SCSI host adapter that will connect to your MegaBus slot. I think ICD might still be selling some of these internal boards. Have a look at :
http://www.icd.com/atari/

You didn't mention how much memory you have in your Mega. Originally, There were 1, 2 and 4Mb versions (the MegaST1, MegaST2, and, yes, MegaST4), all sharing the same motherboard, but with more or less populated memory banks. The max the MMU can handle seems to be 4Mb.

The easy way (plugging in SIMMs) is a no go. The moderately difficult way would be getting a memory expansion board (not sure who does ones for the Mega). The hard way would be filling in the empty memory banks by individually soldering in all the missing memory chips, a few other components, and praying you didn't screw up anything on the way.

I think you're referring to the PARCP package which requires a special home-built cable, not standard lap-link ones. I'm not an expert in parallel communication, but probably the signals used by the ZIP and by the PARCP package are not the same. It's not a bidirectionality issue either, as STs have bidirectionnal ports.

BTW, there is a // zip drive solution available in Germany that connects to the cartridge port.

> nothing to do with ACSI. The ACSI connector or DMA connector is on the back of
> the Mega.

Not entirely correct. The Mega has an internal ACSI-connector as well,
it's a 20 (?) pin connector right below the batteries.

To connect a SCSI-drive to this you'll have to buy a ICD-interface
(Micro? I'm not sure what it's called.) which I believe also is
supplied with mounting-brackets for a 3.5" drive.

>>Is it true that the HD must not be terminated (first time i hear of an
>>unterminated SCSI-Bus ?!?)?

Not true in the case of ICD-interface. But the original SCSI-cards for
the Atari Mega *STE* was a bit peculiar and could actually be damaged
by terminated drives.

The ICD-interfaces are a lot more sensible, but unfortunelately none
of them except Link II supports parity-checking.

> You didn't mention how much memory you have in your Mega. Originally, There
> were 1, 2 and 4Mb versions (the MegaST1, MegaST2, and, yes, MegaST4), all
> sharing the same motherboard, but with more or less populated memory banks.
> The max the MMU can handle seems to be 4Mb.

He said he had 1Mb, which means he has a Mega 1. I believe these are
quite rare, and differs a bit from "ordinary" Megas. But from what I
remember from the Marpet Xtram Deluxe manual it's not a problem in
upgrading these either.

> The easy way (plugging in SIMMs) is a no go. The moderately difficult way
> would be getting a memory expansion board (not sure who does ones for the
> Mega). The hard way would be filling in the empty memory banks by individually

The Marpet cards works fine in the Mega too.

> soldering in all the missing memory chips, a few other components,
> and praying you didn't screw up anything on the way.

With some knowledge it's quite possible to solder in a couple of
SIMMs, but I'd definelately recommend getting a Marpet-board
instead...

>It won't, the Link is DMA to SCSI and won't work the other way around -

I find that surprising. When used normally it has to translate ascsi
bus signals to scsi bus signals and then take responses from scsi and
convert them for ascsi bus. Seems like it has to work both directions.

I actually thought I had used it the other way around - I had hooked
up a HD - forget now if it was a supra or an ICD by putting the link
in backwards and using it with my Falcon to retrieve some files off
of it. It was several years ago and as I get on in age, some of this
is only a vague memory - but I thought I was successful. If I finish
my work for a ScanX demo for this coming week's SCAT meeting early, I
may go back and try it again. Wayne

ICD does still exist. And Tom at least answers my emails (which are
infrequent.) Tom is often found at either the College of DuPage
Computer show (roughly monthly) and the DuPage County Fairgrounds
Computer Show (also roughly monthly and sometimes at Orland Park
or one of the Northern Chicagoland suburbs). I do check with him
when I see him to see how Pro 7.0 is coming along. It is basically
done but for some testing on some of the newer Atari clones. My
choice will remain with ICD Pro - they have never failed me in the
past and that kind of quality deserves loyalty.

Hello to all,

I was given an email earlier this morning from an individual who gave me a link for the Techstocks website, within the website it reference that JTS had filed an 8K form for the sale of assets, specifically Atari to Hasbro Interactive.

I decided the only way to know for sure if this was fact or fiction was to go to the source, since JTS is a publicly traded I went to the SEC site at www.sec.gov

So go to www.sec.gov, go to the Edgar Archives, select 8K and type in JTS for the ticker and Viola!!! You get for February 23, 1998 the sale of most Atari assests to
Hasbro for (GET THIS!!!) only $5,000,00!!!

Its real, its true and its official, Atari has been sold!!!!!!!!!!!!!!!!!!!!!!!!!!!!

So here I am with some questions.

How can I make a program with the extension .st or .msa run on my good old stfm.

I know how to switch from .st to .msa and from .msa to .st and I know that you have to use .st for PacifiST but how can I use .msa for my ST.

Cheers Wilco

4912. How to make it run on my ST II?

Item 2. Acquisition or Disposition of Assets.
- --

On February 23, 1998, JTS Corporation (the "Company") sold substantially
all of the assets of the Company's Atari Division, consisting primarily of
Atari
home computer games and the intellectual property rights and license
agreements
associated with such games (the "Atari Assets"), to HIACXI, Corp. ("HIAC"), a

wholly-owned subsidiary of Hasbro Interactive, Inc., for $5,000,000 in cash. The purchase price was determined based upon arm's-length negotiations between the Company and HIAC. The Atari Assets were acquired by the Company in July 1996 when the Company merged with Atari Corporation. There is no material relationship between HIAC and the Company, any of its affiliates, any director or officer of the Company, or any associate of any such director or officer.

Item 7. Financial Statements and Exhibits.

JTS CORPORATION AND
THE DISPOSITION OF THE ATARI DIVISION

UNAUDITED PRO FORMA CONDENSED FINANCIAL STATEMENTS

The following unaudited pro forma condensed financial statements give effect to the disposition of the Atari Division which was consummated on February 23, 1998. The accompanying pro forma condensed balance sheet as of November 2, 1997 assumes that the disposition of the Atari Division by the Company took place on November 2, 1997. The accompanying pro forma condensed statements of operations for the year ended February 2, 1997 and the nine months ended November 2, 1997 assumes that the disposition took place as of the beginning of the periods. The pro forma condensed statements of operations do not include the effect of any nonrecurring charges directly attributable to the disposition. The results are not necessarily indicative of what would have occurred had the disposition actually been made at the beginning of each of the respective periods presented or of future operations of the Company.

EX-99.1
2
EXHIBIT 99.1

Exhibit 99.1

ASSET PURCHASE AGREEMENT

THIS ASSET PURCHASE AGREEMENT (THIS "AGREEMENT") IS ENTERED INTO ON FEBRUARY 23, 1998, BY HIAC XI, CORP., A DELAWARE CORPORATION ("BUYER"), AND JTS
CORPORATION, A DELAWARE CORPORATION ("SELLER").

RECITALS

This Agreement contemplates a transaction in which Buyer shall purchase certain assets (and assume certain future obligations) of Seller in return for the consideration described herein. Buyer is a wholly-owned subsidiary of Hasbro Interactive, Inc.

NOW, THEREFORE, the parties, intending to be legally bound, hereby agree as
follows:

I. CERTAIN DEFINITIONS. As used in this Agreement, the following terms have the meaning given to them below:

"Acquired Assets" means the following assets of Seller:

A. All right, title and interest in and to the Seller's Products;

A. All Intellectual Property associated with the Seller's Products, including the Intellectual Property identified on SCHEDULE 1, and remedies past and future against infringements thereof and rights to protection of interest therein;

A. The license agreements listed on SCHEDULE 2 (the "License Agreements");

(d) All of Seller's claims, causes of action, choses in action, rights of recovery, set-off and recoupment relating to or arising out of any right, property or asset included in the Acquired Assets; and

(e) all business and financial records, books, files, plans, documents, correspondence, lists, drawings, notebooks, specifications, creative materials, advertising and promotional materials, marketing materials, studies and reports of Seller, whether written or electronically stored or otherwise recorded if, and only to the extent, that such foregoing items relate to the Acquired Assets (not including the items of this clause (e) for these purposes) or Assumed Liabilities (subject to Section 5(b)).

Notwithstanding the foregoing, the Acquired Assets shall not include the Excluded Assets.

"Assumed Liabilities" means only liabilities and obligations arising after the Closing under each License Agreement actually assigned to Buyer pursuant to this Agreement.

"Atari Hardware Platforms" means the following hardware platforms: Atari 2600, 5200, 7800, Lynx hand-held and Jaguar game system hardware, Atari 800, ST and Falcon 030 computer family hardware, TOS operating system, 8-bit operating system, and Portfolio palmtop computer.

"Excluded Assets" means the following assets:

(a) inventory, receivables, furniture, fixtures and equipment;

(b) any tax assets of Seller, including pre-paid taxes, tax credits and tax carryovers;

(c) all tax returns and tax records whether or not related to the Acquired Assets;

(d) the $45,000 balance of the royalty guarantee owed to Seller on December 31, 1997 by Interplay Productions, Inc. under Amendment One to the Game License Agreement dated July 29, 1996, between Atari Corporation and Interplay Productions, Inc. and as otherwise identified in SCHEDULE 3;

(e) software developed by or for Seller or its predecessor under license of intellectual property rights from a third party or third parties for use on the Atari Hardware Platforms to the extent that such software is not related to or associated with any of the trademarks and copyrights set forth in SCHEDULE 1 or any of the game titles set forth in SCHEDULE 3;

(f) Hardware embodying Intellectual Property (other than Seller's Intellectual Property) that is licensed from third Persons.

(g) all assets associated with or related to Seller's disk drive business.

"Hardware" means equipment, components, circuitry, integrated circuits, processors, casings, layouts (including synthesizable code), mask works, manufacturing data, and all designs, schematics, tooling, formulae, processes, and know how therefor (whether or not any such items are presently embodied in physical components) and related Intellectual Property.

"Intellectual Property" means any or all of the following and all statutory and/or common law rights throughout the world in, arising out of, or associated therewith: (i) all patents and applications therefor and all reissues, divisions, renewals, extensions, provisionals, continuations and continuations-in-part thereof; (ii) all inventions (whether patentable or not), invention disclosures and improvements, all trade

secrets, proprietary information, know-how and technology; (iii) all works of authorship, "moral rights", copyrights (including derivative works thereof), mask works, copyright and mask work registrations and applications; (iv) all industrial designs and any registrations and applications therefor; (v) all trade names, logos, trademarks and service marks, trademark and service mark registrations and applications together with the good will of the business symbolized by the names and the marks; (vi) all computer software including all source code, object code, firmware, development tools, files, records and data, all media on which any of the foregoing is recorded; (vii) Uniform Resource Locators, World Wide Web site addresses and domain names; (viii) any similar, corresponding or equivalent rights to any of the foregoing; (ix) all documentation related to any of the foregoing; and (x) all goodwill associated with any of the foregoing.

"Key Marks" means each of the following marks: Atari, the Fuji logo, Asteroids, Battlezone, Breakout, Centipede, Combat, Crystal Castles, Millipede, Missile Command, Night Driver, Pong, Ultra Pong, Tempest, Warlords and Yar's Revenge.

"Knowledge" means actual knowledge of (i) the senior executives of Seller or (ii) John Skruch.

"Lien" means any mortgage, pledge, lien, security interest, charge, claim, equity, encumbrance, restriction on transfer, conditional sale or other title retention device or arrangement (including a capital lease), transfer for the purpose of subjection to the payment of any indebtedness, or restriction on the creation of any of the foregoing, whether relating to any property or right or the income or profits therefrom.

"Person" means an individual, a partnership, a corporation, an association, a joint stock company, a trust, a joint venture, an unincorporated organization, or a governmental entity (or any department, agency, or political subdivision thereof).

"Registered Intellectual Property" means all United States, international and foreign: (i) utility and design patents, design registrations and utility models and all pending applications (both regular and provisional) for any of the foregoing; (ii) registered trademarks, service marks or trade names, applications to register trademarks, service marks or trade names, intent-to-use applications, or other registrations or applications related to trademarks, service marks or trade names; (iii) registered copyrights and applications for copyright registration; (iv) any mask work registrations and applications to register mask works; (v) Uniform Resource Locators, World Wide Web site addresses and domain names and (vi) any other Seller Intellectual Property that is the subject of an application, certificate, filing, registration or other document issued by, filed with, or recorded by, any state, government or other public legal authority.

"Seller Hardware" means Hardware included in the Acquired Assets.

"Seller's Intellectual Property" means Intellectual Property of Seller that constitutes an Acquired Asset.

"Seller's Products" means (i) those products of Seller acquired by Seller pursuant to the merger of Atari Corporation, a Nevada corporation, with and into Seller on July 30, 1996, and any other products of Seller thereafter derived therefrom, including products relating to or associated with the trademarks set forth in SCHEDULE 1 (including video and computer games, games for handheld devices, consoles, Internet play, all other games for play on any platform whatsoever (subject to the License Agreements), and merchandise bearing any Intellectual Property relating to or associated with the foregoing, whether now offered for sale or license by Seller or discontinued) and (ii) all of Seller's products that are listed on SCHEDULE 3.

I. SALE AND PURCHASE; ASSUMPTION OF LIABILITIES; PURCHASE PRICE; CLOSING.

A. SALE AND PURCHASE OF THE ACQUIRED ASSETS. At the Closing (as defined below), on the terms and subject to the conditions of this Agreement, Seller shall sell and Buyer shall purchase all of the Acquired Assets for the sum of $5 million to be paid at the Closing by wire transfer to an account designated by Seller.

A. ASSUMPTION OF LIABILITIES. In addition, at the Closing, on the terms and subject to the conditions of this Agreement, Buyer agrees to assume and become responsible for all of the Assumed Liabilities at the Closing. Buyer shall not assume or have any responsibility, however, with respect to any other obligation or liability of Seller that is not an Assumed Liability. Without limiting the foregoing, Buyer shall not assume or be responsible for any liabilities relating to events arising or occurring prior to the Closing, regardless of when payable, and all such liabilities shall be for the account of Seller.

A. CLOSING; CLOSING DELIVERABLES. The closing shall occur in the offices of Wilson Sonsini Goodrich & Rosati, 650 Page Mill Road, Palo Alto, California 94304 upon the execution and delivery of this Agreement by the parties hereto ("Closing"). At the Closing the parties will deliver the following documents, and such additional documents as the parties may agree to transfer ownership of the Acquired Assets to Buyer (which shall be in form satisfactory to both parties) :

1. Seller shall deliver:

(A) A bill of sale for the Acquired Assets.

(B) Global trademark assignments.

(C) Country-specific trademark assignments.

(D) Patent assignments in recordable form.

(E) Assignment of the License Agreements.

(F) Copyright assignment.

(G) Global powers of attorney respecting trademarks.

(H) Country-specific powers of attorney respecting trademarks.

(I) Assignment of Internet domain name.

(J) Disclosure Schedule (as defined below).

1. Buyer shall deliver:
(A) The purchase price by wire transfer.

(B) An instrument of assumption of the Assumed
Liabilities.

A. ASSIGNMENT OF CONTRACTS AND RIGHTS. Anything in this Agreement
to the contrary notwithstanding, neither this Agreement nor the consummation
of
the transactions contemplated hereby shall constitute an assignment, or an
agreement to assign, any Acquired Asset or any claim or right or any benefit
arising thereunder or resulting therefrom (a "Consent-Required Asset") if an
attempted assignment of such Consent-Required Asset, without consent of one or
more third parties, would constitute a breach or other contravention thereof
or
would in any way adversely affect the rights of Buyer or Seller thereunder;
PROVIDED, HOWEVER, that once all such consents are obtained, this Agreement
shall automatically effect an immediate assignment of such Consent-Required
Asset without further action by either party hereto. Buyer and Seller will
use
their commercially reasonable efforts (which shall not be deemed to require
any
payment of money or other value by Seller or Buyer) to obtain the consent of
the
other parties to any such Consent-Required Asset for the assignment thereof to
Buyer as Buyer may reasonably request. If such consent is not obtained, or if
an attempted assignment thereof would be ineffective or would adversely affect
the rights of Seller thereunder so that Buyer would not in fact receive all
such
rights, Seller and Buyer will cooperate in a mutually agreeable arrangement
under which Buyer would obtain the benefits and assume the obligations
thereunder in accordance with this Agreement, including sub-contracting or
sub-licensing to Buyer, or under which Seller would enforce for the benefit of
Buyer, with Buyer assuming Seller's obligations, any and all rights of Seller
against a third party thereto. Seller will promptly pay or assign to Buyer
when
received all monies received by Seller with respect to any Consent-Required
Asset and any claim or right or any benefit arising thereunder, except to the
extent the same

represents an Excluded Asset. Nothing in this Section 2(d) shall be construed
to diminish the representations, warranties and covenants of Seller respecting
such consents.

I. REPRESENTATIONS AND WARRANTIES OF SELLER. Seller represents and
warrants to Buyer that the statements contained in this Section 3 are correct
and complete as of the Closing, except as set forth in the disclosure schedule
separately delivered by Seller to Buyer with this Agreement, which schedule
shall be initialed for identification by the parties (the "Disclosure
Schedule"). Except as expressly set forth in this Agreement and the
Disclosure
Schedule, Seller hereby expressly disclaims any and all other warranties of
any
kind or nature, whether express, implied or statutory, relating to the
Acquired

Assets, including the implied warranties of title, non-infringement, merchantability and fitness for a particular purpose. Buyer acknowledges that the Seller Hardware is transferred "as is" and that, notwithstanding anything to the contrary in this Agreement and the Disclosure Schedule, Seller makes no representation or warranty of any kind with respect to the Seller Hardware.

A. ORGANIZATION OF SELLER. Seller is a corporation duly organized, validly existing, and in good standing under the laws of the State of Delaware.

A. AUTHORIZATION OF TRANSACTION. Seller has full corporate power and authority to execute and deliver this Agreement and to perform its obligations hereunder. Without limiting the generality of the foregoing, Seller has taken all corporate and other action required for the execution, delivery and performance of this Agreement by Seller, including the sale of the Acquired Assets as provided herein. This Agreement constitutes the valid and legally binding obligation of Seller, enforceable in accordance with its terms. The persons who have executed this Agreement on behalf of Seller have been duly authorized to do so.

A. NONCONTRAVENTION. Neither the execution and the delivery of this Agreement, nor the consummation of the transactions contemplated hereby, shall (i) violate any statute, regulation, rule, judgment, order, decree, stipulation, injunction, charge, or other restriction of any government, governmental agency, or court to which Seller is subject or any provision of the charter or bylaws of Seller or (ii) conflict with, result in a breach of, constitute a default under, result in the acceleration of, create in any party the right to accelerate, terminate, modify, or cancel, or require a notice under any contract, lease, sublease, license, sublicense, franchise, permit, indenture, agreement or mortgage for borrowed money, instrument of indebtedness, security interest, or other arrangement to which Seller is a party or by which it is bound or to which any of its assets is subject, except where the violations, conflicts, breaches, defaults, accelerations, terminations, modifications, cancellations or failures to give notice, individually or in the aggregate, would not have a material adverse effect on the Acquired Assets, the Assumed Liabilities or the ability of the parties to consummate the transactions contemplated by this Agreement (a "Material Adverse Effect"). Seller need not give any notice to, make any filing

with, or obtain any authorization, consent, or approval of any government or governmental agency in order for the parties to consummate the transactions

contemplated by this Agreement, except where the failure to do so, individually
or in the aggregate, would not have a Material Adverse Effect.

A. CONSENTS. No approvals or consents of or assignments by any person (including any federal, state or local governmental or administrative authorities) are necessary in connection with the execution, delivery or performance of this Agreement.

A. TITLE TO THE ACQUIRED ASSETS. Seller has good and marketable title, free and clear of all Liens, (i) to the Acquired Assets identified on SCHEDULE 1 (other than copyrights that are not identified on SCHEDULE 4), SCHEDULE 3 and SCHEDULE 4 and (ii) to its Knowledge, to all other Acquired Assets. At the Closing, Buyer shall obtain good and marketable title, free and
clear of all Liens (i) to the Acquired Assets identified on SCHEDULE 1 (other than copyrights that are not identified on SCHEDULE 4), SCHEDULE 3 and SCHEDULE
4 and (ii) to its Knowledge, to all other Acquired Assets.

A. MATERIAL CONTRACTS. True, correct and complete copies of the License Agreements have been delivered to Buyer. Seller has performed in all material respects all obligations required to be performed by Seller under the License Agreements. To the Knowledge of Seller, each of the other parties to the License Agreements has performed in all material respects all the obligations required to be performed by them thereunder to date. Each License Agreement (i) is valid, binding and enforceable in accordance with its terms, (ii) is in full force and effect with no default or dispute existing or, to the
Knowledge of Seller, threatened with respect thereto, and (iii) shall not be terminated or otherwise affected by the execution and delivery of this Agreement
or the consummation of the transactions contemplated hereby. No consent of any
third party is required for the assignment of any License Agreement to Buyer. Seller has provided Buyer with a complete and accurate list of payments paid to
Seller by each licensee under the License Agreements, indicating the licensee and the month paid, from June 30, 1996 to present. Seller has not received any
advanced payments (including prepayments of royalties, or other payments by reason of which a licensee is entitled to reduce its current or future royalty or payment obligations) under the License Agreements which have not been earned
by Seller.

A. INTELLECTUAL PROPERTY.

1. To the Knowledge of Seller, SCHEDULE 1 contains a list of all trademarks and service marks and applications therefor included in the Acquired Assets that have not lapsed and that are, except as qualified therein, Registered Intellectual Property (the "Registered Marks"), all patents and applications therefor that are included in the Acquired Assets that are Registered Intellectual Property (the "Registered Patents"), and United States copyrights included in the Acquired Assets, certain of which are Registered Intellectual Property. SCHEDULE 3 contains certain game titles that are included in the Acquired Assets. To the Knowledge of Seller, (A) the description of the Registered Marks on SCHEDULE 1 contains, to the extent set forth and

except as qualified therein, the true and accurate date of registration, registration number, registered owner and the class of the Registered Marks, (B) the description of the Registered Patents on SCHEDULE 1 contains the true and accurate patent number and file date of the Registered Patents, and (C) the description of the United States registered copyrights on SCHEDULE 1 included in the Acquired Assets that are Registered Intellectual Property contains the number of such copyright registration.

1. Since July 30, 1996, to the extent that any Seller's Intellectual Property has been developed by any Person other than Seller for which Seller has, directly or indirectly, paid, Seller has a written agreement with such Person with respect thereto and thereby has obtained ownership of, and recordable title to, and is the exclusive owner of, all developed Seller's Intellectual Property by operation of law or by valid assignment.

1. Except as set forth in any License Agreement, Seller has not transferred ownership of or granted any license of or right to use or authorized the retention of any rights to use any Seller's Intellectual Property to any other Person.

1. The Seller's Intellectual Property constitutes all Intellectual Property used in and/or necessary to the conduct of Seller's Atari division business as currently being conducted by Seller.

1. To the Knowledge of Seller, neither Seller's Products included in the Acquired Assets nor the use of Seller's Intellectual Property, (A) infringes upon or misappropriates the Intellectual Property of any Person, (B) violates the rights of any Person (including rights to privacy or publicity), or (C) constitutes unfair competition or trade practices under the laws of any jurisdiction. Seller has received no notice from any Person claiming that Seller's Products included in the Acquired Assets nor the use of Seller's Intellectual Property infringes upon or misappropriates the Intellectual Property of any Person or constitutes unfair competition or trade practices under the laws of any jurisdiction (nor, to the Knowledge of Seller,

is there any basis therefor).

1. There are no contracts, licenses or agreements between Seller and any other Person with respect to Seller's Intellectual Property under which there is, to the Knowledge of Seller, any dispute or any threatened dispute regarding the scope of such agreement, or performance under such agreement including with respect to any payments to be made or received by Seller thereunder.

1. To the Knowledge of Seller, no Person is infringing or misappropriating any Key Mark, other than such infringements or misappropriations that, individually or in the aggregate, would not have a Material Adverse Effect on such Key Mark.

1. Seller and, to the Knowledge of Seller, each prior owner of the Seller's Intellectual Property have taken whatever reasonable steps that are required to protect rights in confidential information and trade secrets of such Person and its successors.

1. None of the Seller's Intellectual Property is subject to any proceeding or outstanding decree, order, judgment, agreement or stipulation that restricts in any manner the use, transfer or licensing thereof by Seller or may affect the validity, use or enforceability of such Seller's Intellectual Property.

1. Seller is not required to make or accrue any royalty payment to any third party in connection with the sale, distribution, license, transfer or other disposition or exploitation of any of the Acquired Assets.

1. Seller has not developed any new video game software since July 30, 1996.

1. Seller owns no Intellectual Property not included in the Acquired Assets that is directly or indirectly competitive with the Seller's Intellectual Property.

1. (A) Alan Helbush is the Administrative Contact listed in the domain name record on file with Network Solutions, Inc./InterNIC Registration Services, and (B) Seller controls the domain name "ATARI.COM".

1. None of the Intellectual Property associated with the Seller's Products, including the Intellectual Property identified on SCHEDULE 1, or remedies past and future against infringements thereof and rights to

protection of interest therein is an asset specified in clause (g) of the definition of "Excluded Assets" set forth in Section 1.

A. SUFFICIENCY OF ASSETS. The Acquired Assets include all assets, properties and rights necessary for compliance by Buyer with all obligations relating to the Assumed Liabilities.

A. LITIGATION. There is no claim, dispute, action, proceeding (including arbitration), suit or appeal, or investigation, at law or in equity,
pending (other than those, if any, with respect to which service of process or similar notice has not yet been made and which are not within the Knowledge of Seller) or, to the Knowledge of Seller, threatened against Seller or involving any of the assets or properties of Seller before any court, agency, authority, arbitration panel or other tribunal that would have a Material Adverse Effect.

There is no outstanding order, writ, injunction or decree of any court, agency,
authority, arbitration panel or other tribunal, and Seller is not in default with respect to any notice, order, writ, injunction, or decree, in each case relating to, or affecting the Acquired Assets, the Assumed Liabilities or the Seller's Products.

A. UNDERLYING DOCUMENTS. Copies of all documents listed or described in the Disclosure Schedule and the Schedules hereto have been furnished or made available to Buyer. All such documents are true, correct and
complete copies, and there are no amendments or modifications thereto.

A. BROKERS' FEES. Seller has no liability or obligation to pay any
fees or commissions to any broker, finder, or agent with respect to the transactions contemplated by this Agreement for which Buyer or its affiliates could become liable or obligated.

A. COMPLIANCE WITH BULK SALES LAWS. The sale, transfer and assignment by Seller to Buyer hereunder and the consummation of the other transactions contemplated hereby do not constitute a "bulk sale" by Seller, and
it is not necessary under the laws of any jurisdiction that Seller comply with the bulk sales laws of such jurisdiction.

A. DISCLOSURE. Neither this Agreement nor any of the Schedules nor,
to the Knowledge of Seller, any other documents delivered by Seller in connection with this Agreement contains any untrue statement of a material fact
or omits a material fact necessary to make the statements contained herein or therein, in light of the circumstances in which they were made, not misleading,
and, to the Knowledge of Seller, there is no fact that has not been disclosed to

Buyer that materially affects adversely or could reasonably be anticipated to materially affect adversely the Acquired Assets, or the operation of the Acquired Assets by Buyer as currently conducted by Seller.

I. REPRESENTATIONS AND WARRANTIES OF BUYER. Buyer represents and warrants to Seller that the statements contained in this Section 4 are correct and complete as of the Closing.

A. ORGANIZATION OF BUYER. Buyer is a corporation duly organized, validly existing, and in good standing under the laws of the state of Delaware.

A. AUTHORIZATION OF TRANSACTION. Buyer has full power and authority (including full corporate power and authority) to execute and deliver this Agreement and to perform its obligations hereunder. This Agreement constitutes the valid and legally binding obligation of Buyer, enforceable in accordance with its terms. The person who has executed this Agreement on behalf of Buyer has been duly authorized to do so.

A. BROKERS' FEES. Buyer has no liability or obligation to pay any fees or commissions to any broker, finder, or agent with respect to the transactions contemplated by this Agreement for which Seller or its affiliates could become liable or obligated.

A. NONCONTRAVENTION. Neither the execution and delivery of this Agreement by Buyer, nor the consummation by Buyer of the transactions contemplated hereby, will violate (a) any provision of the Certificate of Incorporation or bylaws, as amended, of Buyer or (b) any statute, regulation, rule, judgment, order, decree, stipulation, injunction, charge or other restriction of any government, governmental agency or court to which Buyer is subject.

A. ASSESSMENT OF VALUE. Buyer has been authorized by its ultimate parent entity to make a good faith assessment of the fair market value of the Acquired Assets, has made such assessment, and has determined that the fair market value of the Acquired Assets as of the Closing is less than $15,000,000.

I. POST-CLOSING COVENANTS AND AGREEMENTS.

A. COOPERATION. Each party shall, at all times following the Closing, not take any action inconsistent with the satisfaction of its obligations hereunder and, subject to the following sentence, shall promptly take any further action necessary or desirable to carry out the purposes of this Agreement (including the execution and delivery of such further instruments and documents) as the other party may reasonably request. Seller shall take all actions reasonably requested by Buyer, at Buyer's expense (provided that Buyer shall not be obligated for any cost to Seller in respect of the time of Seller's

employees, officers or directors), to enable Buyer to establish a recordable chain of title to the Acquired Assets, including contacting prior owners of items thereof to request appropriate instruments for recordation.

A. DELIVERY. Immediately following the Closing Seller shall deliver to Buyer, and Buyer shall accept and remove from Seller's premises at Buyer's expense within 30 days of the date of Closing, all copies of tangible embodiments of Acquired Assets transferred to Seller (other than software and code, and such other items as the parties may mutually agree, which shall be transferred electronically on or immediately following the Closing and all tangible embodiments of which shall thereafter be destroyed by Seller); PROVIDED, HOWEVER, that (i) any information contained in such materials listed in clause (e) of the definition of "Acquired Assets" that does not relate to the Acquired Assets may be deleted by Seller before such materials are delivered to Buyer and (ii) Seller may make copies of any business or financial documents (other than documents containing Seller Intellectual Property) prior to delivering them to Buyer. Except as provided in Section 5(c), Seller shall cease use of the Seller's Intellectual Property, including the name Atari and the "Fuji" logo relating thereto.

A. SELLER INVENTORY. Seller owns certain unsold inventory of games bearing the Atari and/or Fuji trademark, and certain other Registered Marks and containing other Seller's Intellectual Property (the "Inventory"). Buyer hereby grants to Seller an irrevocable, worldwide, royalty-free license, for a period of one year from the date of the Closing to use the Registered Marks and other applicable Seller's Intellectual

Property relating to such Inventory solely for the purpose of selling the Inventory. Except as set forth in the previous sentence, after the Closing Seller shall have no right to exploit the Seller's Intellectual Property. Without limiting the foregoing, Seller shall not, following the expiration of the one-year license period set forth above, sell any product referred to in clause (e) of the definition of "Excluded Assets" set forth in Section 1. Seller warrants that the Inventory sold pursuant to this Section 5(c) shall be of like kind and quality to that previously sold by Atari Corporation in the ordinary course of its business.

A. NOTICE OF DEVELOPMENTS. Seller shall give prompt written notice to Buyer of any material development that could have a Material Adverse Effect. Each party shall give prompt written notice to the other of any material development affecting the ability of the parties to perform their post-Closing obligations under this Agreement.

A. ENFORCEMENT OF RIGHTS. In connection with the enforcement of its rights of ownership of the Acquired Assets and the enjoyment thereof, Buyer may bring actions in the name of Seller, or cause Seller to join any such action as a party, as reasonably necessary, provided that Buyer shall indemnify Seller with respect thereto.

A. MAINTENANCE OF INTELLECTUAL PROPERTY; DELIVERY OF NOTICES. After the Closing, Seller shall not be responsible for the maintenance or renewal of any registration with respect to the Acquired Assets, such responsibility to belong to Buyer as the owner of the Acquired Assets; PROVIDED, HOWEVER, that Seller shall promptly forward to Seller any and all notices and correspondence which it may receive pertaining to the Acquired Assets; and FURTHER PROVIDED that Seller shall remain responsible for the maintenance and renewal of registration with respect to all of the Consent-Required Assets retained by Seller pursuant to Section 2(d) of this Agreement as a consequence of the failure to obtain a required consent of a third party until such time as the applicable consent is obtained.

A. LITIGATION SUPPORT. In the event and for so long as Seller actively is contesting or defending against any action, suit, proceeding, hearing, investigation, charge, complaint, claim or demand in connection with any fact, situation, circumstance, status, condition, activity, practice, plan, occurrence, event, incident, action, failure to act, or transaction involving the Acquired Assets or the Assumed Liabilities, Buyer will provide access upon prior request and during its regular business hours to the books, records and other items specified in clause (e) of the definition of Acquired Assets set forth in Section 1 as shall be reasonably necessary in connection with the contest or defense, all at the sole cost and expense of Seller and subject to Seller's execution and delivery of Buyer's standard form of confidentiality agreement with respect to such items.

I. INDEMNIFICATION.

A. INDEMNIFICATION AND REIMBURSEMENT OF BUYER'S LOSSES. Seller shall indemnify Buyer and its affiliates, together with their respective officers, directors and employees (each a "Seller's Indemnitee") against Losses (as defined below) as set forth in this Section 6. If a Seller's Indemnitee shall have suffered a Loss by reason of (i) the breach of any of the representations or warranties made by Seller herein, (ii) any matter arising prior to the Closing with respect to the Seller's business, an Acquired Asset or an Assumed Liability, (iii) any liability of Seller that is not an Assumed Liability or (iv) any breach of a covenant of Seller hereunder, Seller's Indemnitee shall be reimbursed for such Loss by Seller as set forth in this Section 6. For purposes hereof, "Loss" shall mean any losses, liabilities, claims, damages and expenses incurred or reasonably expected to be incurred,

including penalties, fines, interest, amounts paid in settlement and reasonable fees and disbursements of counsel, and expenses incurred in connection with any investigation, action, suit or proceeding instituted against an indemnified party. Notwithstanding the foregoing, Seller shall have no obligation to indemnify Seller's Indemnitees for Losses which, cumulatively, total less than $25,000; PROVIDED, HOWEVER, that if cumulative Losses equal or exceed said $25,000, then Seller shall indemnify Seller's Indemnitees for all of such Losses. Liquidated Claims (as defined below) actually paid by Seller under this Section 6 shall be limited to an aggregate of $5 million.

A. INDEMNIFICATION AND REIMBURSEMENT OF SELLER'S LOSSES. Buyer shall indemnify Seller and its affiliates, together with their respective officers, directors and employees (each a "Buyer's Indemnitee") against Losses as set forth in this Section 6. If a Buyer's Indemnitee shall have suffered a Loss by reason of (i) the breach of any of the representations or warranties made by Buyer herein, (ii) any matter arising after the Closing with respect to the Buyer's business, an Acquired Asset or an Assumed Liability, provided such matter is not related to or arising from any breach of a covenant, representation or warranty of Seller or any act or omission by Seller involving wilful misconduct, fraud or bad faith, or (iii) any breach of a covenant of Buyer hereunder, Buyer's Indemnitee shall be reimbursed for such Loss by Buyer as set forth in this Section 6. Notwithstanding the foregoing, Buyer shall have no obligation to indemnify Buyer's Indemnitees for Losses which, cumulatively, total less than $25,000, provided however that if cumulative Losses equal or exceed said $25,000, then Buyer shall indemnify Buyer's Indemnitees for all of such Losses. Liquidated Claims actually paid by Buyer under this Section 6 shall be limited to an aggregate of $5 million.

A. PAYMENT. At such time as the reimbursable amount of a Claim or a Third Party Claim has been determined in accordance with this Section 6 (a "Liquidated Claim"), the indemnifying party shall immediately pay the Person to be indemnified hereunder (an "Indemnitee") the amount of the Liquidated Claim.

No forbearance of an Indemnitee in demanding payment from the indemnifying party shall act as a waiver of any right of an Indemnitee to receive payment from the indemnifying

party, nor shall it relieve the indemnifying party of any obligation to an Indemnitee under this Agreement.

A. NOTICE OF CLAIMS. In the event an Indemnitee has any claim for indemnification under Section 6(a) or Section 6(b) (a "Claim"), it shall give

prompt written notice thereof to the indemnifying party, including in such notice a brief description of the facts upon which such claim is based and the amount thereof.

A. THIRD PARTY CLAIMS.

1. If any third party shall notify an Indemnitee with respect to any matter (a "Third Party Claim") that may give rise to a claim for indemnification against a party hereto (the "Indemnifying Party") under this Section 6, then the Indemnitee shall promptly notify the Indemnifying Party thereof in writing; PROVIDED, HOWEVER, that no delay on the part of the Indemnitee in notifying the Indemnifying Party shall relieve the Indemnifying Party from any obligation hereunder, unless (and then solely to the extent) that the Indemnifying Party is prejudiced.

1. The Indemnifying Party shall have the right to defend the Indemnitee against the Third Party Claim with counsel of the Indemnifying Party's choice reasonably satisfactory to the Indemnitee so long as (A) the Indemnifying Party notifies the Indemnitee within 15 days after the Indemnitee has given notice of the Third Party Claim that the Indemnifying Party will indemnify the Indemnitee as required by (and subject to the limitations of) this Section 6 for Losses arising out of, relating to, in the nature of, or caused by the Third Party Claim; (B) the Indemnifying Party provides the Indemnitee with evidence reasonably acceptable to the Indemnitee that the Indemnifying Party will have the financial resources to defend against the Third Party Claim and fulfill its indemnification obligations hereunder; (C) the Third Party Claim involves only money damages and does not seek an injunction or other equitable relief; (D) settlement of, or an adverse judgment with respect to, the Third Party Claim is not, in the good faith judgment of the Indemnitee, likely to establish a precedential custom or practice materially adverse to the continuing business interest of the Indemnitee; and (E) the Indemnifying Party conducts the defense of the Third Party Claim actively and diligently.

1. So long as the Indemnifying Party is conducting the defense of the Third Party Claim in accordance with Section 6(e)(ii) above, (A) the Indemnitee may retain separate co-counsel at its sole cost and expense and participate in the defense of the Third Party Claim; (B) the Indemnitee shall not consent to the entry of any judgment or enter into any settlement with respect to the Third Party Claim without the prior written consent of the Indemnifying Party (not to be withheld unreasonably); and (C) the Indemnifying Party shall not consent to the entry of any judgment or enter into any settlement with respect to the Third Party Claim without the prior written consent of the Indemnitee (not to be withheld unreasonably).

1. In the event any of the conditions in Section 6(e)(ii) above

is or becomes unsatisfied, however, (A) the Indemnitee may defend against, and consent to the entry of any judgment or enter into any settlement with respect to, the Third Party claim in any manner it reasonably may deem appropriate (and
the Indemnitee need not consult with or obtain any consent from, any Indemnifying Party in connection therewith); (B) the Indemnifying Party shall reimburse the Indemnitee promptly and periodically for the reasonable costs of defending against the Third Party Claim (including attorneys' fees and expenses), and (C) the Indemnifying Party shall remain responsible for any Losses the Indemnitee may suffer resulting from, arising out of, relating to, in
the nature of, or caused by the Third Party Claim to the fullest extent provided
in this Section 6.

A. DISPUTED CLAIMS. If Seller objects to any Claim or Third Party Claim, it shall give written notice of such objection and brief statement of the
grounds of such objection to Indemnitee within 20 business days after notice is
received. If no such objection is given, such Claim or Third Party Claim, as the case may be, shall be a Liquidated Claim. If such objection is made, Indemnitee and Seller shall meet and use their best efforts to settle the dispute in writing that when resolved shall be a Liquidated Claim.

A. SURVIVAL. The provisions of this Section 6 shall survive the Closing. Notwithstanding anything to the contrary in this Agreement, no Claim or Third Party Claim may be asserted by a Seller's Indemnitee under this Section
6: (i) with respect to Losses arising in connection with the obligation to pay
taxes, following the date of the expiration of the applicable statute of limitations for such obligation; (ii) with respect to a Loss arising out of or in connection with a License Agreement, following the termination of such License Agreement in accordance with its terms; and (iii) with respect to all other Losses, following August 31, 2000. No Claim or Third Party Claim may be asserted by a Buyer's Indemnitee under this Section 6, other than Losses arising
with respect to the Assumed Liabilities, following August 31, 2000. Notwithstanding the preceding sentence, an Indemnitee may assert a Claim or Third Party Claim under this Section 6 with respect to Losses that are the result of fraud or wilful misconduct by the Indemnifying Party at any time within the applicable statute of limitations for such claim.

A. The right of each party hereto to assert Claims and receive indemnification payments pursuant to this Section 6 shall be the sole and exclusive right and remedy exercisable by such party with respect to any breach
by the other party hereto of any representation or warranty or failure to perform any covenant required to be performed by such other party; PROVIDED, HOWEVER, that the above shall not prevent a party hereto from seeking specific

performance of a covenant which another party hereto has failed to perform under
this Agreement.

I. MISCELLANEOUS.

A. NO THIRD PARTY BENEFICIARIES. Except as otherwise specified herein, this Agreement shall not confer any rights or remedies upon any person other than the parties and their respective successors and permitted assigns.

A. ENTIRE AGREEMENT. This Agreement (including the documents referred to herein) constitutes the entire agreement between the parties and supersedes any prior understandings, agreements, or representations by or between the parties, written or oral, that may have related in any way to the subject matter hereof.

A. SUCCESSION AND ASSIGNMENT. This Agreement shall be binding upon
and inure to the benefit of the parties named herein and their respective successors and permitted assigns. Seller shall not assign any of its rights, interests or obligations hereunder without the prior written consent of Buyer.

Buyer may assign its right, interests and obligations hereunder to any Person provided that such permitted assignee agrees to be bound by the terms hereof and
to assume all obligations of Buyer hereunder.

A. COUNTERPARTS. This Agreement may be executed in one or more counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

A. HEADINGS. The section headings contained in this Agreement are inserted for convenience only and shall not affect in any way the meaning or interpretation of this Agreement.

A. NOTICES. All notices, requests, demands, claims, and other communications hereunder in writing. Any notice, request, demand, claim, or other communication hereunder shall be deemed duly given five business days after mailing if sent by registered or certified mail, return receipt requested,
postage prepaid and addressed to the intended recipient as set forth below:

If to Seller:

JTS Corporation
1661 Baypointe Parkway
San Jose, California 95134
Attention: President

Copy to:

Cooley Godward LLP
5 Palo Alto Square
Palo Alto, California 94306

Attention: Andrei M. Manoliu, Esq.

If to Buyer:

HIAC XI, Corp.
1027 Newport Avenue
Pawtucket, Rhode Island 02862
Attention: President

Copy to:

Hasbro, Inc.
1027 Newport Avenue
Pawtucket, Rhode Island, 02862
Attention: General Counsel

Copy to:

Wilson Sonsini Goodrich & Rosati
650 Page Mill Road
Palo Alto, California 94304
Attention: Eric W. Wright, Esq.

Any party may give any notice, request, demand, claim, or other communication hereunder using any other means (including personal delivery, expedited courier, messenger service, facsimile, telex, ordinary mail, or electronic mail), but no such notice, request, demand, claim, or other communication shall be deemed to have been duly given unless and until it is received by the person for whom it is intended. Any party may change the address to which notices, requests, demands, claims, and other communications hereunder are to be delivered by giving the other party notice in the manner herein set forth.

A. GOVERNING LAW. This Agreement shall be governed by and construed in accordance with the laws of the State of California as such laws are applied to agreements entered into and to be performed entirely within California by California residents.

A. AMENDMENTS AND WAIVERS. No amendment of any provision of this Agreement shall be valid unless the same shall be in writing and signed by Buyer and Seller.

A. EXPENSES. Each of Buyer and Seller shall bear its own costs and expenses (including legal fees and expenses) incurred in connection with the negotiation and preparation of this Agreement and the transactions contemplated hereby. Buyer shall, pursuant to Section 5(a) of this Agreement, bear all costs

and expenses of the recordation of chain of title to the Acquired Assets, including preparation and recordation of appropriate assignments of the Acquired
Assets.

A. CONSTRUCTION. The language used in this Agreement shall be deemed to be the language chosen by the parties to express their mutual intent,
and no rule of strict construction shall be applied against any party. Any reference to any federal, state, local, or foreign statute or law shall be deemed also to refer to all rules and regulations promulgated thereunder, unless
the context requires otherwise. Except as otherwise specified, references in this Agreement to Sections and Schedules are to Sections of, and Schedules attached to, this Agreement. Except where the context clearly requires to the contrary, "including" shall mean "including, without limitation".

A. SCHEDULES. The Schedules identified in this Agreement are incorporated herein by reference and made a part hereof.

A. TRANSFER TAXES. Any and all sales, use or other transfer taxes arising from the transactions contemplated by this Agreement shall be paid by Seller.

A. CONFIDENTIALITY OF INFORMATION. All information given to a party
by the other party in connection with this Agreement ("Confidential Information") shall be used only for purposes related to the consummation of the
transactions contemplated herein, and shall be disclosed to the receiving party's employees and representatives only on a "need to know" basis in connection with such purposes. If the Closing does not occur for any reason, each party shall maintain in confidence all Confidential Information of the other party, shall return to the disclosing party all tangible embodiments (and
all copies) of such Confidential Information and shall not use such Confidential
Information for any purpose; PROVIDED, HOWEVER, that the forgoing restrictions shall not apply to: (i) information that is or becomes a matter of public knowledge through no act or failure to act of the receiving party, its representatives or employees, (ii) information that becomes available to the receiving party from a source not under an obligation of confidentiality to the
disclosing party, or (iii) information that was known to receiving party prior to its disclosure to the receiving party by the disclosing party.

IN WITNESS WHEREOF, the parties have executed this Asset Purchase Agreement
on the date first above written.

Now, the question is, will Hasbro Interactive do anything worthwhile with
Atari. I did notice that the computers were specifically listed as being
part of the deal. It makes me curious that they specifically mentioned
the computers (8-bit, ST, Falcon, and TOS), so does that mean there is
some plan to use this for something? I mean, $5 million for Atari is a
good chunk of money. I wonder who we can get to tell more of this deal.
Sure enough $5 mil is not worth it for Atari's management......

Maybe Hasbro has a game system in the works and wants to use the Atari
label.......

I'm sure in the coming months rumors will start to appear everywhere!

$5 million is actually a very small sum of money for the name alone, if the right people can act upon the right memories of the right consumers. That the computer lines are included is either complementary or central to their plans; that's what we'll be watching for. Don't necessarily expect anything right off the bat. Many wise investors, seeing an opportunity, act well in advance of any plans, buying when others are fleeing... a la Warren Buffet buying 20% of worldwide above-ground silver reserves recently. He's just waiting... he can afford to.

I thought I recently heard that Hasbro was laying off several hundred employees and closing a plant. I wonder if the Atari purchase has anything to do with this. Could be a refocusing of their management's vision. Hmmm... an Atari web-box? No reason you can't sell one today for $99.

Here's a quick and dirty translation fo the homepage from this site:

--------------8<---------------8<-------------

Hello to all Internet travelers.

We (the TOS4you'98 meeting team) created a website to be able to keep the most up-to-date information for the Atari Fair planned by the Pro Atari Computer Club (a registered association). This fair is a new fair, unrelated to the Neuss fair scheduled for the beginning of April.

Where and when? The fair will be held In Schaafheim, near Aschaffenburg [tr. -- it looks to be near Frankfurt on the Main river, excitingly near where I once lived for a year] on the first weekend in May (2nd and 3rd of May, 1998).

A list of exhibitors, a meeting calendar, and a map of the area are available at the website http://www.pac-ev.de/index.htm.

You can get the HTML code of these webpages, with all necessary graphics, from our BBS, which was created particularly for this purpose. The BBS computer can simultaneously serve as a faxserver so that you can receive the most important information from it also by fax. The phone number for both services is: 06028 - 996726.

Should we have forgotten some important or interesting information, please call us or send us eMail or faxes with your questions using the information below:

For potential commercial exhibitors: Peter Kotulla; Tel. 06028-996724; Fax 06028-996725; eMail peter_kotulla@ab.maus.de; Memeler Stra�e 10 * 63843 Niedernberg.

Regarding the website, faxserver or mailsite, and for private exhibitors: Arne Sch�rmann; Fax & Tel. 06181-850264; eMail arne_schuermann@of.maus.de; Bruchk�beler Landstr.110a * 63452 Hanau.

Regarding the presentations schedule, contact Marcus Stolzenberg; Fax 09373-99825; Am Weinberg 51 * 63937 Weckbach.

Didn't Hasbro already inherit the corpse of Coleco? Fifteen years after the 1982 home video game wars, the two big players end up as bunkmates. :)

: 5 million is chump change for Hasbro, especially after just having
: purchased Tiger Electronics last month (Feb 9th) for 335 million.
: Which leads me to....

Atually, for all that Atari embodies, $5 million is dirt cheap. The
question is, did they finally get rid of the Tramiel family...

: My conspiratorial mind is highly curious if there might end up being
: some form of game.com / Atari collaboration now. Perhaps use the Lynx
: technology to give the Com a much-needed shot in the arm?

Why would they want to do something with the Lynx, although it probably
was the cheapest portable game technology they could get, could make them
cheap now...

: Why wait months when we can start now? :)

Basically I see three scenarios....

1) They wanted the games, to follow the froger path...
2) They wanted the name for a new game system or other application...
3) They couldn't pass on the price with all of the pack ins they are
getting.... all of Ataris technology and patents for the last 20 years....

This makes sense too. First of all the Lynx is by no means outdated
considering how far handheld consoles go these days. Secondly no one
seems to want a Tiger Game.com, maybe they want and Atari Game.com.
Secondly, purchasing two game companies leads me to believe they have
something planned. Perhaps Hasbro will make a console, portable or
standard (or even liscense Project X) and use technology from both
companies or names to form something.

I would think the want the Atari name perhaps for something else. Maybe they want to release the Jaguar 2 and try to beat Playstation, in theory it is more powerful than current consoles and could compete with the next according to the few rumors surrounding it.

Thanks for the info. I read the document and one very interesting part
is
the fact that Hasbro will take the rights to the website domain
"atari.com"
It looks like Hasbro will be using the name Atari for something, but
what
that might be is still up for speculation.

When Atari bought into JTS there were many who said that Atari was DEAD!

It definately looks like some restoration will be happening.

Thank you Hasbro in advance for whatever you may do!

Patrick Mulvey
Pres. LIAUG

(and thanks again Curt!)

Hehehee.. I'm not sure I like any of them. Someone wanted to start some rumors, here is one. I guess you all know of VM-Labs which are supposed to cooperate with a number of big companies. I have no idea what Hasbro does, but maybe JHasbro+VM-Labs have something to do with this as well? :-)

Another possibility would be that it would be esier for a seconde company to buy out the computer part and TOS. As they sold the whole shit for 5 mill, I guess the computer part would be very cheap as I guess this is not what they were after in the first place.

Well, maybe IBM could buy the computer and release a PPC TOS box, or Compac or Dell could buy it just for the fun to rival Gateway2000? The price for the computer part would be a fart in space for those guys. :-)))))

Anyway, here you are.

MSA stands for Magic Shadow Archiver. MSA_II can be found on umich.

If they aren't intrested in the computer line or TOS, perhaps we can see
TOS under a open license or even freely aviable. The same goes for the
hardware schematics, sadly there isn't much money left in a computerline
that was abadoned some 5 years ago, even if one as a enthusiast like myself
don't like that fact. Today people buys a PC not a homecomputer... ;-(But
perhaps Hasbro are more open than JTS where.

Just my 2 cents.

Regards..

i believe those lay offs were planned to come at the factory in rhode
island. though i doubt that really has anything to do with the atari
purchase.

> switches to 15 pin SVGA.
> I hope this helps.

Depends on what you want. If you only need to run hi-res (black & white)
programs, then you can use (almost?) any SVGA monitor with a correct
adapter (Atari b/w signal tied to SVGA R,G,& B, horizontal and vertical
syncs respectively and a ground path somewhere... also tie Atari pin 4
to ground). I believe you must make the adapter yourself; have fun with
the 13-pin DIN!

As the SM 124 uses something like 31.5 kHz Horizontal, a SVGA should
have no problem with this. You must remember, anyhow, that you can not
display any color resolutions this way, only hi-res, even if the monitor
is a color one. So, most games & graphics programs woni¿½t go, but things
like Calamus, Cubase, Papyrus etc. are a lot nicer on a 15" screen...

Doni¿½t overdo it by using a 17" or bigger screen, the pixels will become
annoying!
Oh yes, and for sound you must use some external amp, as the PC monitors
usually have no speakers. You will get the sound signal from pin 2 of
the Atari (if I remember right, consult your manual).

Regards,
Markku

Desoldering chips isn't fun at the best of times! :-)

When I managed to break a pin off whilst bending it upwards to install a serial port speeder I was able to use an end mill in a modelmaker's drill to grind my way through the top of the chip until I met the horizontal bit of leg just where it exited from the chip. Bit of cleaning and there's your solder point.

Thats true, I suppose they could have let the site die if they had no
use for it, but since they took the site it would seem that they plan
on using it for something. I also noticed if I try to go to
http://www.atari.com it just sits hangs, claiming it is connecting, but
nothing becomes of it.

So perhaps we should petition Hasbro to make some of the old Atari
8-bit and ST stuff freeware.

Maybe make the custom chip details public, and license theem for free
non-comercial (or limited production, say under 1000 units) use.

Perhaps relase the source for the various operating systems under
something like the Netscape Public License.

I think we should think about what they could do that would:
a) make us hobiests happy
b) not provide any advantage to their competitors
c) not deprive them of potential future revenue
d) not cost them much of anything to release

Source record: 13581

I have run the serial port on a Falcon at 230Kbaud using HSModem from Harun Scheutzow. I connected it to a Hayes Optima v.34(which runs at 230Kbaud DTE at 8/1 compression). However, performance is much better if you replace the SCC chip(8530) with an ESCC chip(Zilog 85230). I did these on both my Falcon and my TT030. Real world compressible files, such as images and databases are compressed about 6/1 in the modem, yielding an effective transmission rate of a megabyte/min(just as advertised by Hayes!). Of course you need a similar capability on the other end!!! HSModem supports the added buffering of the ESCC chip.

(speculation)
10. Hasbro wants to sue somebody because they are copyright freaks. (Nobody interested in Atari has any money, so they can't get any money.)
Comment on sale of Atari to Hasbro.
From my point of view, it means that a large, active (in Atari) corporation now owns the rights to all Atari copyrights.
Being a bit paranoid, I'd suggest that any sites carrying Pac-Man, Star Raiders, or any other Atari held product should think about what Hasbro might want to do with those products, ie. be careful about having Atari products up for download. They may justifiably say such activities interfere with their ability to make a profit, even if the activities are without profit motive.

Guys,

In all seriousness, the Jaguar is DEAD, it will not be revived, there
wont be a Jag II, forget any hopes on that, there is a possibility
(slim) for the Lynx though. If there will be
a console system it will be a Project X console or this rumor of a 68040
console, but
guys get it through your heads, Jag is DEAD. I love my Jag but its
DEAD. Look for
Retro PC Atari titles and titles for other systems, and hope for a
Project X licensing with
Atari on the case and Atari Retro Project X software, THAT is the only
reality here.

We all love the Jag, but it is DEAD, get used to it, no Jag in the
future.

Perhaps the Atari 26000 ??? Maybe.

Curt

I doubt it. After all, why pay $5 million for all of the rights just to avoid licensing one of Atari's patents? Nintendo, Sega, and Sony are always bumping into one or more of Atari's patents every day, yet this doesn't bother them one bit.

>2) Hasbro is only interested in the game franchises so that they can make

I apologize if this sounds rude, as I don't intend it that way.

What amounts to the changing of hands of Atari ownership, IMHO, is pretty darn relevant to any Atari-related newsgroup. I would imagine that most Atari fans were elated at the news. Even though I don't know what plans Hasbro has for their newly acquired Atari properties (which, BTW, does include the ST line), I'd bet my bottom dollar that it's a whole hell of a lot more than what JTS has done.

I don't blame anyone one bit for crossposting. To an Atari aficionado, this is front page news; it deserves to be seen by anyone who shares even a remote interest in anything to do with Atari.

Wow... A once million dollar business, Atari has been sold for a mere $5,000 US... the once powerful dominator of the 80s video game industry has been reduced to $5,000... Do you know what Hasbro plans for the Atari Fuji symbol et al?

Um, a lot of video games there days are costing $3 million, so $5 mil
for an entie library of assets, patents, titles and a name is chicken
feed.

The Lynx is probably one of the primary reasons for the purchase. It's not really outdated when you compare it to the LameBoy.

You all might want to check out Jaguar Interactive II. There's someone there (who I believe is from Hasbro) posting much information on this deal. The Lynx is definitely part of it too...

Has there ever been a device built which could perform high-speed networking between a PC and an Atari ST? Is Ethernet possible? If not would it be possible to build my own custom device? What about over parallel port? I understand the ST's parallel port is not birectional, but what about interfacing the ST's cartridge or hard drive ports to the parallel port on the PC?

Can any hardware geeks out there help me? I'm sure something like this must have been built in the past...

Yes, there are some Ethernet solutions.

There was a project to attach a PC parallel port ethernet adapter to the ST
cartridge port which is on the net, but the ethernet adapters are expensive &
hard to get.

There is also somebody working on a ASCI port ethernet adapter.

If not
>would it be possible to build my own custom device?

Yes if you know how, probably better to use one of the ready solutions.

What about over
>parallel port? I understand the ST's parallel port is not birectional,

It is bidirectional, but lacks some control pins, that's why the PC adapters
had to be attached to the cartridge port (with some control logic also).

>but what about interfacing the ST's cartridge or hard drive ports to the
>parallel port on the PC?

I assume you mean direct attachment of the ST ports to the PC ports. There is
a transfer program which links ST's to PC's called PARCP. It's really an FTP
solution, but it is fast (at least 40Kbytes/second). Perhaps this may evolve
into a network solution.

For $5000, one of us would have bought it ;-)

You forgot to add a few zero's to that figure. The Atari name definately
has some worth left in it. Hopefully with the renewed interest in
classic
gaming, Hasbro will capitalize on this. We'll see what happens though...

That's true - Aixit's MagnumST board adds another MMU and together with
TOS2.06 or MagiC you can go up to 12Mb or so.

Should fit inside a MegaST case OK, you solder an IC socket over the
processor.

www.aixit.com IIRC.

What really gets me is they seem to have paid $5 million for $45 million in Atari debt (and of course, the technology). They _really_ paid $50 million for the assets. They are obviously planning to do something real with it, simply suing for patent and copyright infringement and selling licensing won't generate that kind of revenue.

Secondly, I am puzzled by the omission of the TT in the hardware listing. I gues they just hit on the biggies (though I would think there are more TTs than Falcons), or is the TT an "ST".

I'm _still_ glad I sold the stock as soon as I came back up to break-even. JTS isn't looking too healthy is it?

*** Expose Digitiser ♦150***

Hi all,
I have got an Expose digitiser that works with the Atari Falcon.
It is very easy to fit and has worked with every piece of visual equipment
that I have plugged into it.
In fact the only reason why I am selling this beauty is because I no longer
have a Falcon.
If you are using your Falcon for graphics then you should be aware of the
Titan-Black scorpion range of Hardware and Software. This product
complements the brand new range of ground breaking hardware and software
which is already available and soon to be released for the Falcon.
These include;
Apex Media
Apex Alpha
Nemesis
Falcam and
Tripod.

Hello,

if you are interested in experimenting with Highspeed Packet Radio
(9600bd) and want to save money instead of buying a $$$ 9k6 TNC, make
your own cheap&simple modem, developed by Chris - OE5DXL
At this moment there are drivers available for Atari (L2STX), PC DOS
(L2PCX) , PC Windows and LINUX.

(for atari ST the driver L2STX also can be used for 1200bd baycom alike
modems, PC users can use Baycom driver for 1k2 modems)

More info and files/links you can find on my webpage at:
http://www.qsl.net/pe1nib/index.html

73's Chris de PE1NIB

>licensing won't generate that kind of revenue.
>
Well first they bought Tiger Electronics not Atari? Why would they buy
both unless they had something planned, would be too much a waste of
money. Game.com is not moving on shelves too well. Perhaps they want to
do something in the way of video games but need a largely remembered
name like Atari. Suing for patent and copyright infingement could get
you good money depending on who or what is involvled. If it is simply
Jon Doe's Video Game Inc infinged on the patent of a design of
something totally meaningless by todays standard, you wouldnt get much,
but if it was Nintendo, Sony or Sega you could fetch more (Atari did
once already on Sega) especially if it had to do with something in the
Playstation console itself that couldnt be changed they could claim
damages millions and maybe make quite a bit of money.

The only way they could make any money with Jaguar anymore would be to get the Jag/Jag CD combo out at well under $100. That way they could attract some 3rd party developers to the CD, but IMO it is too late in the current generation to make enough that way, especially now that the Saturn will be officially canned at the end of the month. Another problem is power, the Jaguar is supposedly more powerful than Saturn (the Jag CD supposedly allows optimum access to this power) but is still is not at the level of Playstation in 3D. It probably could turn out convincing 2D platformers and 2D fighters though. I think a Project X liscense would be a better bet for the Atari name.

Oh,- yes you can.
In the second pull down menu from the left side, there is a option that says
WP Mode. If you deselect this, you will be saving your doc in ascii mode,
without any formatting.

Both have internal scsi adaptors which only support the internal drive.
You need an external scsi host adaptor to connect additional scsi
devices to the dma port on the back of the machine. For best performance
with modern peripherals the ICD Link 2 is preferred.

Nah. Considering how desperate JTS is for cash, they could have gotten
the license for said technology much cheaper.

>
> 2) Hasbro is only interested in the game franchises so that they can make
> games for other systems using Atari owned characters and lisences.

This sounds very likely. Regardless of what else Hasbro may do with the
Atari properties, I am quite sure we'll see this.

>
> 3) Hasbro wants to enter the handheld game market and plans to rerelease
> the Lynx.

This also sounds possible to me. Purchasing Tiger shows they have an
interest in the handheld market, and perhaps even gives them a plant or
two to manufacture the Lynx in. Perhaps even the ability to fabricate
their own LCD screens? Should bring down manufacturing costs
considerably!

Wouldn't a faster, higher-resolution Lynx be cool? Woo-hoo! (Imagine a
Lynx with a 320x200 screen, running at double the clock speed, with 3D
support in hardware, and a built-in [or bundled] TV tuner, all for only
$99. I like it!)

But man, I really hope they don't try to sell it as the Tiger Lynx!
Yuck.

>
> 4) Hasbro wants to enter the home console market and plans to rerelease
> the Jaguar as a "budget" home video game console for around $50.

No way, they couldn't manufacture the Jaguar chep enough to really meet
this price point. And the Jaguar's dated technology and poor reputation
would really be unable to compete against the strong current market
share of the PSX and N64. I love my Jaguar, but I'm afaid it is too dead
for this.

>
> 5) Hasbro wants to enter the home console market and plans to release
> an upgraded Jaguar to compete against the N-64 and PS.

Well, the Jaguar II design (AKA Project Midsummer) was completed, and
was supposedly quite powerful. I believe the hardware could compete if
they came up with some good software for it. But I would sooner bet that
Hasbro is a Project X licensee then say they intend to revive the
Midsummer architecture.

>
> Fantasy: (In order of what I'd most wish for)
>
> 1) Atari will be fully revived and once again take it's rightful place

Any notion of Hasbro putting the Atari logo on a piece of hardware
pretty much goes hand-in-hand with this one!

>
> 2) Hasbro wants to make a very cheap hand held game machine. What they

> for under $30.

Never happen. And personally, I'd rather see the Lynx come back. Though
it would be cool to see a 2600/7800 emulator for the Lynx. You could
easily cram a couple dozen games on a single Lynx cart, along with the
emu software. (Hey, it could happen - the Lynx does have a 6502-based
CPU, after all!)

I heard somewhere that it could supposedly do 5,000,000 polygons a
second, which if true would make it plenty powerful.

There's a shareware program called Marcel for the ST which can import
ST programs and save them in RTF format. Would save you some
formatting on the PC. I don't know how much memory Marcel needs though
- it might not run in only 512k of memory, which I mention as your
drive is 360K. However, you will probably Marcel runs under an
emulator though.

>25,000 posts and replies to my question of how to do it all over the
>newsgroup. Thanks!

I think I wrote that and it is way out of date - well it must be if I
can't even remember (either www130 or www131) !!

The installer (the bit I wrote) will work fine and sets it up for you
but the versions of STiK and Cab contained within it stand very little
chance unless your ISP provides a plain uncompressed SLIP connection
(because the contained modules are so old now). Get STiNG and a newer
Cab instead.

If you've already run it, run it again (it can be run over and over
without harm) and note down where it copies files and then delete them
manually to save yourself some space. The only really important bit
however is to get rid of the installed STiK so it doesn't conflict
with STiNG.

You have to turn WP mode off (I think it's in the 'File' menu) before you
can save as ascii text.

If you already have a lot of FWP docs to convert then I think that there
might be some converters around on the ftp sites?

Possibly! ;)

Project X (I think it is also called Merlin) is a new game system designed by VM Labs. Many former Atari people worked on the design, including one or two of the engineers who designed the Jaguar and Midsummer machines, and programmer Jeff Minter (Tempest 2000, Llamatron, Defender 2000, and so on.) And Bill Rehbock, another former Atarian, left his position at Sony to head up the recruitment of third party developers for Project X.

The marketing model sounds similair to the 3DO - multiple manufacturers sign a license to build hardware. There are supposedly several "Sony sized" manufacturers already signed on, but the only one known at this time is Phillips. They have said we will learn a lot more at E3.

It is the clear Atari connection to the hardware's designers that makes many people feel like this console will be the unofficial heir to the Atari legacy. In fact there was a rumor that Phillips was seeking to license the Atari name from JTS for their model of the Project X console. So while their is no concrete connection between Project X and Hasbro's purchase, many of us hope that there will bo one eventually.

4992. ST video problems

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-15 00:00:00 UTC
From: Puppy Dawg <swallow@intergate.bc.ca>
Message-ID: <350CCBF5.7CCD@intergate.bc.ca>
Source record: 13627

Hi. My 520 ST has recently lost its video signal (?) Its not a power problems, as it still turns on, and spins up the floppy drive. But no video. It happened mid-game. I was just playing a game, when the screen lost it vertical hold. I paused the game, and adjusted the TV. It was fine for about a minute, then the screen started to blue to one side. It then proceeded to drop lines, and then some colour. Then it filled with static, and after a moment, died altogether. I fiddled with all the connections (exterior) that I had, but nothing change. I turned the ST off. I cam back an hour later, to see if it was any better (thought it might have overheated, causing connection to fail, or something like that) No signal. It sends a slight signal (not sure wether throught the cable or via radiation) as the tv flickers slightly when the ST is turned on. Any suggestions?

Any help would be greatly appreciated!

Puppy Dawg

Yes, it can be adapted, but on the ST's serial port. You also need a special
driver like mouse25.prg that goes into your Auto folder.

Cheers,
Nick

Out of the ether, the following was mentioned by joska@nuts.edu...:

j> You should go to Petr Stehlik's homepage, he has compiled a
j> special AB-version fo the MiNT-kernel. I'm using it right now
j> (1.14.5 or 1.14.6) and I have never experienced any problems with
j> it.
Yep, Petr's pointed it out to me already, thanks.

I've downloaded it now, just a case of giving it a try.

Out of the ether, the following was mentioned by Harry...:

HS> programming an application and running MON he would get the
HS> application running through the graphics card with the debug info
HS> appearing on a simultaneously connected SM124.
HS> Not being a programmer I wasn't motivated to follow this up, but
HS> it's certainly possible from what he said...
Hmmm, when I used to have my EIZO 6500 on the TT I could have the application displaying on the monitor via the TC1208e graphics card and the output from MON going into the TTL connector on the same
monitor.

So I could run normal output on the monitor at 1280x1024 and get the debugging output on the same monitor at 1280x960. The only caveat was that when you were actually using the debugger front end all program execution stopped (so it was just a static display).

There is no reason why I couldn't use a similar setup with my CTX monitor, would just have to run the debugger output in say TT medium rez. Never really got on with assembler level debugging though.

There's once again an even more simple solution:

With a new host adapter at the ACSI port (LINK2) or a real SCSI port at TT
or Falcon you can build up a SCSI network with multi initiator function.

Simply connect PC (must have a SCSI card...) and the ATARI by a SCSI cable
(not to long, verify correct SCSI bus termination) and set the ATARIs SCSI
ID to 6 (or any other, but not 7) and use HDDRIVER.
Now you can access any SCSI drive formatted to DOS format (possible with
PC or ATARI->HDDRIVER) from both machines! Transfer rates of about 2MB/sec
with an TT or 1.5MB/sec with ST or Falcon are possible, no matter in which
machine the hard disk is installed.

The PC should run Win95, with 3.11 it crashes when the ATARI boots up...

Try it!
Greetings,
Carsten

I recently got a free 520 STFM and a nice nearly new SC 1224 from a friend and was wondering how much I could get for the 520. I need the monitor for my 2 Ataris (MEGA STe & 1040 STf) but am going tompart with the 520. It has 1 MB RAM, TOS 1.04 I think and thats about it. I can throw in the 25+ disks that I got with it. Let me know.

Hasbro bought Tiger because of their excellent position in children's
electronics. Tiger makes tons of handheld games, including all of the
game show units (Wheel, Family Feud, Jeopardy!, etc.), Giga Pets, and
the children's educational "computers" (they are the only real
competition to V-Tech). Hasbro is trying to keep up with Mattel in the
toy industry; both are running around buying up all of the smaller toy
companies that complement the businesses that they already own. Tiger
was attractive to them because they really don't have anything in the
way of handheld electronics or kid's computers. They also got ahold of
the game show licenses, which their other divisions can use, like Parker
Brothers, Milton Bradley, and CAP Toys (candy - you've probably seen the
Connect Four and Monopoly candy...expect more!)

Tiger was also bought by Hasbro, Inc., while Atari was purchased by
Hasbro Interactive. This may mean nothing, but it may signal that Tiger
is considered more of a toy company to Hasbro, while Atari is considered

more of a software company. I personally would expect HI to use the software licenses first, making new versions of the titles that they now own, then maybe look at the videogame market to see if it is a viable market for them. They don't own facilities to make something as large as a CD console system and would not be able to make one as cheaply as someone like Philips, but they might license the Atari name. The portable market is about to change a bit with the new Nintendo color portable, so if they're smart, they will wait and see what happens there. Just my $0.02 (still $0.02 with tax!!)

Just for thought, has anyone ever considered calling a 2D game 3D because it is playing from a Picture Tube which in itself is 3D? That would be funny, by that definition, all side scrollers would now be considered 3D games.

Some games have already been revamped. It certainly would take some serious thought for me to go out and by another revamp of Missle Command after Missle Command 3D unless it was a masterpiece of some type.

Hi Peter

So you've bombed out!!! :(((Don't worry it happens to all of us at some time or another.

The cherry bombs on the screen indicate that an 'exception error' has occured. If everything works fine, it was probably one of those things. If you multiply the bombs on the screen by 4 you will get the exception vector that cause the error.

If this is becoming common place without using software you may have a serious problem. I only one piece of software causes it don't be too worried.

I hope this is of help.

Cheers! for now
Steve

I don't mean to be annoying, but doesn't the description:

"1-dimensional games that only last 3 minutes"

apply to just about any console game? In general, I have always preferred computer games to console fighting, platform, and other low depth genre's. With games like AvP, the Jaguar had the potential to bring more computerish titles to the console market, but they instead dropped that sort of development in favor of SNES style titles.

For sale:

Atari 520 STFM
1 MB RAM
TOS 1.04 (I think)

This system has NO mouse and NO monitor. Just the computer it self. It does boot and goes into GEM. Floppy is a low density internal, works fine. System does work but you'll need a monitor and mouse as I mentioned above. I will include about 25 disks of misc Atari software with it too, as I got it with the system. Best offer, all proceeds will go towards my MEGA STe! Please reply via e-mail. Thanks!

I downloaded Povray and was wondering if it was gonna work on my Mega STe? I downloaded version 3.02, it says: Included is one version for plain ST without FPU. That should work correct? And for that matter I am running straight TOS/GEM, I am using a SC 1224 in medium res. I have no VGA/SVGA etc. Is this gonna be a problem? It says that it will work on all TOS machines running any version of TOS etc... I noticed that there are 2 .gtp files in the bin directory. One labeled for ST and the other TT. I am not familiar with a .gtp file. This is an executable? What do I do simply click on it? Help!

5016. MEGAFILE 30 problem

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-17 00:00:00 UTC
From: rich@demon.nl
Message-ID: <350fa269.3734339@news.euronet.nl>
Source record: 13644

I bought my Atari Mega2 a while back and with it came a Megafile 30 HD. I can use two drives now (C and D), each 10Mb. If I'm correct, there should be a third drive (E), but when I install it on my desktop and try to open it, my HD tries to access it for a second and then nothing happens...

Does anybody have any idea how to access my E-drive? I'd be VERY pleased to get that extra 10Mb! :)

Have you checked the partitioning with a utilities program? The
remaining space may never have ben allocated to a parttion OR the
partition data may be corrupt.

I don't know about getting that E: drive back, but you may wanna consider getting a replacement for it. I had a Mega File 30 too and it dies after about 3 months of use! After I bought it of course...so I went to a SCSI setup and all is well! A ICD Link is about $90, but a 50+ MB hard drive will be cheap. Besides you can chain other devices to it too like a ZIP drive or a CD-ROM drive too. Thats just my humble opinion, get all your data onto a SCSI before the Mefa File dies out!

Depending on availability another RLL drive could be a choice. Of course
this might not be considered the sane-rational approach, but otherwise the
drive and controller will wind up in the trash.

IMHO replacing the internal drive is as hard a task as getting a complete
SCSI setup.

I wanted to make a data buffer and a multiplex, very similar to my UNI-BI
adapter (it would just work the other way, i.e. BI-UNI).

IIRC there is a hack to produce a second serial port on the ST. See:

http://www.geocities.com/SiliconValley/Way/8016/sthard.htm

I'm not sure, but it seems that with a hack like that, you could use the PC mouse/trackball/trackpad/ dretc with the ST and keep your modem/printer/etc attached. Food for thought.

There ara a few possibilities:

1) The drive was probably initially divided into two partitions.
solution: there must be about 10 Mb left so
backup both partitions (to floppies of course)
run the HDX utility on the hard disk utility
and partition the disk again into 3 partitions.

2) There is not a 30 Mb, but a 20 Mb drive inside.
solution: If it is a 20 Mb RLL disk, then you have bad luck
If it is a 20 Mb MFM disk, continue reading at 3)

3) The drive has been formatted with the wrong parameters
solution: open the case to find out what kind of drive you have.
I had a 30 Mb Seagate ST238R RLL drive, which I replaced
with a 20 Mb NEC D5126 MFM drive, which I of course
formatted as 30 Mb RLL. I replaced this disk
yesterday with a Maxtor XT-1140 120 Mb MFM drive
(140 Mb unformatted, 120 Mb formatted).
Since I formatted it RLL, I now have about 180 Mb.
You just have to add some things to the wincap file
of HDX.
backup your disk and run hdx to format it again as a
megafile 30, and partition it as you please

If you dont have the HDX utility, the download:

http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/Diskutils/hdx504.lzh

5024. MEGAFILE 30 QUESTION

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-18 00:00:00 UTC
From: hofman@ats.nld.alcatel.nl.nospam
Message-ID: <6eovpc$i1l$1@nlsun1.ats.nld.alcatel.nl>
Source record: 13509

I have a question about the Atari Megafile 30.
What I read somewhere is that the interface board of this drive
is an ACSI to SCSI to MFM to RLL converter.
If this is really true, is not that important to me.
And MFM or RLL disk is connected via 2 cables, one for
control and one for data. Usually one can connect 2 MFM or RLL
drives to the same controller. Those drives must each have their
own data cable, but they share the control cable.
Since I have 2 MFM disks, and I would like to use them both,
but I only have one MEGAFILE 30, I would like to know is if
it is possible to add a second drive.

Regards, Peter

Actually, all computer games are 2D because the CRT has a disply that
is is only two dimensions. In order to be true 3D, one would have to
use one of the available stereoscopic methods like LCD shutter glasses
and such with it.

Hehehe.

I have just ordered couple of Amiga mices from Golden Image (true 400 dpi, 3 buttons) which can be made to work with ST with very little effort (if it already does not have ST-AMiga switch, I didn't bother to ask).
It costs only $10 + posting expences, so instead of complicating my life with PC-mice I would go Amiga-route.
Oh, yes- http://www.questrol.demon.co.uk/gi/default.html

No, that cannot be theoretically possible because the Phosphers on the CRT must be a few molecules thick, hence they are 3D, therefore the 2D game is really 3D. My theory on this would only make sense if you are a cheap skate video game company trying to make money by calling 2D games 3D. I wonder if it could be argued in court ;) Think of it this way most CRTs are not flat, they are rounded meaning they are actually 3D. The phosphers must be 3D anyway you put it because they have some height width and depth. Therefore the phosphors are 3D. If you display something on 3D it must be 3D. The CRT itself is also not flat, the electron gun sticks out the back, but relating the fact that a 3D setup is projecting images than the image must be deduction be 3D. Pretty interesting theory isnt it? Now I need someone to argue the 1D games for me...

Software with original disks and documentation:

Antic Software:
Star Struck the astrologer (will load and work from a hard drive)
Maps and Legends the Cartographer (only runs on old TOS)
Data Map Collection 1
CyberPaint (Pro Animation Studio) from Antic Publishing, Inc.

CAD-3D (version 1.0) [all 3 resolutions]
Human Design Disk (Requires CAD-3D)
Genesis - The Stereo Molecular Modeler (StereoTek Option)
Future Design Disk (Requires CAD-3D)
Fonts, Primitives, Hints and Tips (Requires CAD-3D version 1.0 or 2.0)
3D Developers disk for CAD-3D 2.0
Architectural Design Disk by Darrel Anderson (Requires CAD-3D)

Flash STO220 by Joe Chiazzese and Alan Page (telecommunication package)
[medium and high resolution]

The New Technology coloring book (low resolution only and only works with
the old TOS)

GFA Artist by Michtron
First CADD by Generic software

WANDERER by Pyramid Software includes two (red/green) stereo glasses.
1st Word with manual (versions 1.01 and 1.02)

Fahrenheit 451 by Ray Bradbury (Telarium)

HabaWriter (reported to be the worst word processor ever for the ST!) It
ran properly on my system!

Thunder! spelling checker (Batteries Included) for word processors without
a spelling checker. Works better than the spelling checker in 1st Word
plus

Oo-Topos for Atari 520ST by Polarware (missing the ships map)
The Crimson Crown (further adventures in Transylvania (Polarware)
Temple of Apshai Trilogy by Epyx
TASS TIMES in Tonetown (Activision
Hacker II the Doomsday Papers (Activision)
Mercenary (Datasoft)
Silicon Dreams (Firebird)
Jewels of /Darkness (Firebird)
Flight Simulator II (Sub Logic) only runs from disk
Revolver (Intersect Software) load two or more programs on a 4 meg system.

5032. Help! I Killed My Mega!!

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-19 00:00:00 UTC
From: Tim Curtis <sexsymbol@execpc.com>
Message-ID: <6er0fs$i81@newsops.execpc.com>
Source record: 13517

I just followed instructions that I was given to upgrade my Mega ST4's TOS. It had 1.2 (2 chips) and I replaced it with TOS 1.4 from my old 1040STf (6 chips). Originally I swapped the chipsets and moved the 2 zero ohm resistors at W2 and W3 to pins 1 and 2 and added another zero ohm resistor to W4. Everything seemed to work fine.

I was then instructed to open it back up and pull the IC at U12 (a 74LS11P). I did so - now the machine won't boot. It will only power up with a few random black pixels on the screen or a whole row of bombs running across it.

I suppose the best thing to do is to solder in a 14 pin IC socket and replace the IC - is this the best thing to do?

Did I do something I wasn't supposed to do? What should I do so that everything is correct?

Thanks for any help - I'm feeling a little ill about killing my innocent Mega....

Tim

I think it has to do with the Drive Select logic.
There must be a jumper or a switch to toggle DS0/1 (with an ATARI it is
just the other switch position than with a PC).

Hope to have helped,
Carsten

Hello reader!

I have Atari megafile 30 and was wondering if there is a possibility to
replace a original drive inside the box with a bigger SCSI drive.
Is that possible ? Are ther any ACSI/SCSI compatibility problems ? What
should I do to make the replacement ?

Thank You!

Sinisa

5036. Re: Help! I Killed My Mega!!

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-19 00:00:00 UTC
From: jlog@zetnet.co.uk
Message-ID: <6es96j$q3n$1@irk.zetnet.co.uk>
Source record: 13521

On 19 Mar 1998 05:48:56, Tim Curtis wrote:
|I just followed instructions that I was given to upgrade my Mega ST4's
|TOS. It had 1.2 (2 chips) and I replaced it with TOS 1.4 from my old
|1040STf (6 chips). Originally I swapped the chipsets and moved the 2
|zero ohm resistors at W2 and W3 to pins 1 and 2 and added another zero
|ohm resistor to W4. Everything seemed to work fine.
|
|I was then instructed to open it back up and pull the IC at U12 (a
|74LS11P). I did so - now the machine won't boot. It will only power up
|with a few random black pixels on the screen or a whole row of bombs
|running across it.
|
|I suppose the best thing to do is to solder in a 14 pin IC socket and
|replace the IC - is this the best thing to do?
|
|Did I do something I wasn't supposed to do? What should I do so that
|everything is correct?
|
| . . .

Checking what you did against Atari Technical Note ST/HW/0059 which
came with my 1.4 TOS seems to indicate that what you did was right.
Are the new roms in their correct slots with the correct
orientation? They should be:

U3 C300641-002
U6 C300642-002
U9 C300643-002
U4 C300644-002
U7 C300645-002
U10 C300646-002

I don't remember how to work out orientation and the leaflet does
not say anything about it. Finally are the jumpers actually
connected?

re: 3d vs 2d...

Your argument regarding "since the projecting apparatusis 3d, then the image must be 3d" breaks down when you consider a slide projector. When it projects an image to a theoretically perfect screen, the image itself has no depth unless you look at light as a particle. But so far we have not been able to resolve the particle/wave dispute. My own idea is that it is something _else_, that we as humans in our particular frame of reference cannot see it as it is. Perhaps it is 4-D or more in nature, and humand find it difficult at best to perceive more than 3 simultaneous dimensions.

>>replace a original drive inside the box with a bigger SCSI drive.
>>Is that possible ? Are ther any ACSI/SCSI compatibility problems ? What
>>should I do to make the replacement ?
>>

No, it is not possible.
The Megafile 30 has a RLL formatted disk (mine had a Seagate ST238R) and
is not SCSI. Although there is a SCSI host adapter integrated in the
board somewhere.
But, you can replace it with a larger disk. Use a MFM or a RLL disk.
I replaced the ST238R, since I had 10,000 bad sectors, with a NEC
D5126 20 Mb MFM drive which I formatted with HDX as a normal Megafile 30
disk. Now I replaced it with a Maxtor XT-1140 120 Mb MFM disk, which I
formatted and partitioned using CBHD V5.02 (HDX failed), so I now
have a 180 Mb disk.

You can format almost any MFM disk as RLL, giving you 50% more.

Hint:
If you want to use HDX to format a MFM disk as RLL then just add the
drive info (number of heads, etc.) in the wincap file.
MFM disk ussually have 17 sectors/track. RLL uses 26 secters/track.
So use 26 sectors/track in the wincap file.

Regards, Peter

Quick Sale (I need the room!)

Stunning 21 inch flat screen EIZO multisync monitor, bnc analog and ECL (TT high) inputs, max resolution 1600x1400 at 70Hz, as new (very low use). Paper white (mono) display ideal for dtp, midi, cad etc..
This display cost well over 1200 pounds and is as new, offers around 400 pounds.

Email Dr Simon Williams at WilliamsSG@cf.ac.uk or svp@csi.com.

It would be preferable to sell this within the UK unless buyer is prepared to cover shipping costs!

5042. ST Gear (20/3/98) Update

I have a selection of Atari ST titles for sale.

This List Updated 20/3/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^

Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 5
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins
and Space Harrier (20 levels)
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and
Terminator II 'Judgement Day'
Atari 520STE Discovery Xtra Pack 5
Language Disk DE1 (ds)
Final Fight Disks DE2 & DE3 (ds)
Sim City/Escape from the Planet of the Robot Monsters (ds)
9 Lives (ds)

SPORT TYPE GAMES

World Championship Soccer (1d,ds,nb) 2
Ballistix (1d,ss) 2
Superleague Soccer (1d,ss) 2
T.V Sports Football (1d,ss,nb) 3

5045. NextGen review of Once Upon ATARI video

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-20 00:00:00 UTC
From: hsw@netcom.com
Message-ID: <6evdi8$6pe$1@nnrp1.dejanews.com>
Source record: 13530

This is the unedited review of the video documentary "Once Upon Atari"
in Next Generation magazine (April '98 issue, page 20).
You can also check out the website for this video at:
http://www.netcom.com/~hsw/ouatari.html or http://www.netcom.com/~hsw
Here it is:

Once Upon Atari: The Agony and the Ecstasy

video review

The culture at Atari's console division in the glory days of 1979-1982 has always had a mystique about it. It was the seminal videogame development "scene," and many myths and legends grew out of that time. During last June's Electronicon, a Philadelphia fan convention, Howard Scott Warshaw, creator of E.T. and Yars Revenge, premiered a new documentary, Once Upon Atari: The Agony and the Ecstasy. It is actually the final installment of a planned four-part series that explores those days by interviewing the programmers who created some of console gaming's best-loved (and most hated) titles.

While the video quality sometimes leaves a lot to be desired (the introduction is almost unbearably cheesy), the interviews are amazing. Warshaw has tracked down almost everyone who did anything of significance in Atari's home division, including the people involved in some of the most criticized events in Atari's history, like Pac-Man for Atari 2600 (see "What the Hell Happened?" page 38). The interviews are seamlessly edited together with very little narration, which is good if you are familiar with Atari's history - for those who don't already know most of these names, though, the video may be a bit confusing.

This episode tries to capture the spirit of what it was like to actually work at Atari, an environment that was both a product of the times - the free-wheeling '70s - and the need to hire anyone who could program the 2600, a feat that ranged from difficult to impossible. This quote from Todd (Pac-Man) Frye is typical: "They were having a problem getting a programmer to do the Atari 2600 Xevious. Xevious was a very graphically active game in the arcades, and the Atari 2600 was not really a very graphically active machine. So I went home - I smoked this joint, with a little psilocybin and a little cocaine in it - and all of a sudden it sprang full forth in my mind exactly how to do it. And that was the moment of inspiration."

Other installments will include Nolan Bushnell, Larry Kaplan (Activision, Kaboom!), Rob Fulop (Missile Command), and others, disclosing their personal feelings and stories about everything from the creation of Activision to some of the pretty outrageous sexual (mis)conduct that went on between employees. The remainder of the series will be released later this year. The first episode will cover what it was like to actually work at Atari,

the second will deal with the legendary three M's of Atari (marketing, management, and money), and finally the third - and possibly the most exciting - will detail the game design process at Atari.

The highly in-depth nature of the documentary offers a refreshing contrast to other efforts, like Leonard Herman's Phoenix (see review NG 37), which, in their attempts to cover a broader subject matter, are necessarily more impersonal. Is this video essential viewing? If you're simply interested in the broad history of the industry, probably not. But if the word "Atari" still can make the hair on the back of your neck stand up, send in your money ASAP - you won't be disappointed.

Available in NTSC or PAL. Running time: 28 minutes.
To order, send $29.95 (postpaid) to:

SCOTT WEST PRODUCTIONS
PO Box 610787
San Jose, CA 95161

Nope, the communication protocol between the computer and the harddisk
is called ASCI. This because it is almost the same as SCSI-1. But when
Atari implemented it the SCSI protocol was not a standart yet.
Therefor it is not the same.

The adaptor boards are a interface from ASCI to 1. MFM (megafile 20)
or 2. RLL (megafile 30/60)

> And MFM or RLL disk is connected via 2 cables, one for
> control and one for data. Usually one can connect 2 MFM or RLL
> drives to the same controller. Those drives must each have their
> own data cable, but they share the control cable.
> Since I have 2 MFM disks, and I would like to use them both,
> but I only have one MEGAFILE 30, I would like to know is if
> it is possible to add a second drive.

Yes it is possible. I did this with my Megafile 60 and upgraded it to
a 120mb unit. (2x60mb harddisks) Don't forget you need a special
harddisk driver to access the second disk. Icd will work, but not
AHDI.

Just look on the ftp sites for the documentation how to do it. (It's
german) Archive name:"2ND_MEGA.ZIP"

5049. Atari SC1224 Monitor Info?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-21 00:00:00 UTC
From: Peter Federighi <federighi@thurston.com>
Message-ID: <351410FB.55A364CA@thurston.com>
Source record: 13534

Hello. I was wondering if anyone had pinout and frequency info for the SC1224 monitor.
I am wanting to experiment setting up a fixed frequency monitor with XFree86 under Linux. Would this even be possible with the SC1224?
If you have any info or know of where I can find it on the net, please reply or email me.
Thanks, and have a blessed day.

- Peter

FS: Atari items. ALL OBO Saturday march 21

HARDWARE (no manuals or software)

1.1040STf 1MB ram. TOS 1.4 This machine has an audio output jack (RCA female) so you
can plug in to your external amplifier. Listen to the robot voice or your games loud!! No need for a
pre-amp. Will go with its famous BEETLE mouse!. $62

2. SC 1224 color monitor. It needs detachable video cable $16 (I can give you one that needs
a connector at the other end (free).

3. SC 1224 color monitor. with non detachable video cable and power cable. works great. $24

SOFTWARE:

1. TRUE PAINT V 1.02 $14 Excellent drawing program; all resolutions and colors. Works in ALL
ataris. From B/W. to true color. Manual available.

2. ICD hard disk utilities Version: 6.2.3 2 disks no manual $10. I will send a list of the files upon request.

3. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio video; Also watch
kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $15 (Falcon).
Needs Multitos.

All OBO. Questions welcomed. If interested send ZIP code to ask UPS for charges.. For software I can
send it for $3.00 US. (If you are in the US; I am willing to send abroad also). Phil.

PS: This messages overrides all the others posted before.

Huh? If a game has x and y movement, it is two dimensional.

A vector used to describe the velocity of the "Pong" ball or "Combat"
bullet would need both x and y components.

You're turning simple math into something difficult.

Hi everyone,

I recently downloaded gs333.zoo (from src.doc.ic.ac.uk I believe), and installed it on my Falcon030. Now, even the most simple PS files were unprintable because of several errors reported to me by GS.

Since I am a PS novice, I cannot tell what the exact reason for these errors is. Because GS complains smth about the default font, I think I have to install some font package. Is this correct ?

Could anyone please tell me what I have to install to print out PS documents. Since I have little time to spend on installation troubles, I would highly appreciate an ad-hoc solution.

Thanks anyway,

Hi

I've recently bought myself a used Mega STe. With this computer I got a used Spektrumgrafikkarte (by Wilhelm Mikroelektronik GmbH) on the deal. Now I've been trying all weekend to get this card to work. The card is installed into the machine and I've formatted my harddrive (to ensure that there ain't any conflicts with other progs). After I've installed the HD driver, copied the autofolder from the HD utilities disk and run the install-program from the graphic-card disk, I'm resetting the machine. But during the boot-up, it crashes. How am I going to get this thing to work?!?!?!?!?!

Please help me if you can!
(any tips, hints and step by step guides are VERY appreciated)

Greetings Rolf Anders Storset

I may not be much help as I just today installed GS for Tax forms use.
All I did was to install the package on my F drive, and name the folder
GS. It's a little weird, but then I haven't read the doc's three times
yet. Some forms I can see GS sub a font for another, and other forms,
just a blank screen until the document is loaded. All I have is the
standard NVDI fonts installed. It does take an extreamly long time to
load the tax form I required, but I did manage to get it to print to
my Epson Stylus.

Mike

5064. Atari emulators for windows and Unix (Linux) - tests

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-25 00:00:00 UTC
From: J.B.W.Webber@ukc.ac.uk
Message-ID: <2313@kiwi.ukc.ac.uk>
Source record: 13449

A colleague recently drew my attention to two fairly new programs
for the PC, PaCifiST for Windows, and STonX for an Xwindow on Unix
or Linux, which both emulate the Atari ST.

As they allow me to run some data analysis programs that I depend on,
I was most interested, particularly as they run at 5 to 7 times the speed
of an 8MHz Atari, and offer 14MBytes of memory.

This is what I have found out about the current emulators.
(I restrict the list to what I regard as the most important programs) :

PaCifiST STonX
Tos:
2.06 Yes Yes
+ MultiTos Yes Yes

Auto folder:
Gdos Release 1.1 Yes Yes
FreeMint v1.1.12 Yes Yes
LG FileSelector 1.6 No Yes

File System ext:
Ofake.xfs Yes Yes
Ramfs.xfs Yes Yes

Accessories:
Mdisk (ramdisk) Yes Yes
Xcontrol Yes Yes
Snapshot Yes Yes
TinyTool Yes Yes
TosWindow 1.414 Yes Yes

Ttp, Prg:
Tcsh shell Yes Yes
Elvis (Vi) Yes Yes
Unix tools Yes Yes

Gem Programs:
Apl2 Yes Partly
Wordplus No No
Cad3D2 No No

Both PaCifiST and STonX allow one to mount PC directories as ST partitions,
PaCifiST prefers to work with images of the A,B drives, rather than the
real floppies.

PaCifiST has the strange habit (at the moment) of starting the boot by looking in the C_ partition (where it finds Gdos - loadable fonts), and then jumping
to the (image of) the A drive; thus one needs to put a copy of the Auto folder (and assign.sys, mint.cnf, and any mint .xfs files, and with MultiTos the accessories as well) on the
A image. There is no real problem with this as the A image is as fast as C_ . Every second warm (ST) boot it sees Gdos, but not Mint, so one has to warm boot twice (a warm boot only takes a few seconds on a 200MHz Pentium - even loading Gdos and Mint and opening the windows - this is much faster than the TT - but about 15 seconds with MultiTos).

With STonX, if one defines an A disk, it boots from this rather than C - good for games, but if anyone knows how to keep C as the boot disk, can you drop me a note.

It is a pity that LG fileselector does not work, but if one is using MultiTos, it does not get used anyway.

Mint with or without MultiTos
seems to behave reliably, with Tcsh shell and Elvis (Vi clone) running in Tos Window windows. I have a good set of Un*x utilities installed in both, and my shell scripts work fine (which is vital to me) - does PaCifiST offer the only way of running a Un*x look alike under Windows95 ?

Tt would be nice to have a keyboard reset command. At one point I found that when typing at full speed in PaCifiST
it missed the occasional character, but then I discovered that I could reset kbdrate from 2 to 1 in the monitor, and this cured the problem.

Another feature that would be nice in PaCifiST, would be the ability to connect to
a network postscript printer, either by adding a device /dev/netprn under Mint, or by re-mapping prn: itself. At the moment one has to write a spool.ps file, and then jump to Windows and print using an msdos window.

One major problem with STonX, is that there is a bug probably in some op code implementation, that breaks the ST floating point routines (in Apl at any rate). Any one got the time to look at this? I was wondering what is used by FP but not otherwise, and was wondering if it was EXT : sign extension ?

Next I will post in the Linux development news group 3 bug fixes for STonX, needed for it to compile on our SGI.

I hope this list is of use to some one, I certainly will find these emulators useful. Addresses are :

PaCifiST by Frederic Gidouin

That's been superceded by gs353b now BTW - even that is quite old. Look around on Yahoo for some sites.

> errors is. Because GS complains smth about the default font, I think
> I have to install some font package. Is this correct ?

Yes, there should be some fonts included in the package and you can install PS fonts from other sources. You tell GS about these fonts with the FONTMAP file. Sounds to me that you need to make a careful study of the docs that came with the package, but for me the most reliable results come from setting up a proper environment path rather than use GS's own config file. For example my magx.inf file is:

#_ENV GS_LIB=h:\gs353b,h:\gs353b\ps,j:\postscrp
#_ENV GS_HELPDIR=h:\gs353b\help

The fontmap file lives in the \postscrp folder in my case with the fonts that came with GS and some extras - there's plenty around.

Assuming that GS finds the fonts folder but not the actual font that's called for it'll substitute another so you should be able to get something.

Another issue is that GS has been "hard-wired" to work from one particular partition, but it is possible to make it work from another.

> Could anyone please tell me what I have to install to print out PS
> documents. Since I have little time to spend on installation troubles,
I think that you will have to spend a while to get this all working I'm afraid - but at the least you should get hold of the later version I mention.

A search on www.dejanews.com in the c.s.a.st newsgroup will also pay you dividends, you'll need to go back into the archives.

Yes. Postscript fonts are scalable. There should be a number of font
archives at the same site you downloaded GS itself from. They have
suffix .PFB so you should be able to recognise them easily enough.

> Could anyone please tell me what I have to install to print out PS
> documents. Since I have little time to spend on installation troubles,
> I would highly appreciate an ad-hoc solution.
It took me a little while to get my copy working on my Atari and I
failed miserably until I found a GEM shell for it. The command-line
syntax is <cough> entertaining to say the least.

> or Linux, which both emulate the Atari ST.

STonX isn't new - I tried it about a year ago. You might also be
interested in the fact that there is a version of STonX for DOS
(runs under Win95). There are also a number of emulators (TOSBOX,
TOS2WIN, GEMulator, WinSTon, and probably more I've forgotten).

> Tt would be nice to have a keyboard reset command. At one point I found
> that when typing at full speed in PaCifiST
> it missed the occasional character, but then I discovered that I could
> reset kbdrate from 2 to 1 in the monitor, and this cured the problem.

There are a number of known bugs in PaCIfiST's keyboard handling routines.
Sometimes a key "sticks" (PaCifiST fails to notice the change of state,
and leaves it pressed), which can be particularly annoying if it is the
backspace key.

> Another feature that would be nice in PaCifiST, would be the ability to
> connect to
> a network postscript printer, either by adding a device /dev/netprn under
> Mint, or by re-mapping prn: itself. At the moment one has to write a

I think it is unlikely that this will be supported under MiNT, as PaCifiST
is going for hardware emulation supporting the OS, rather than re-writing
the OS at a higher level. Other emulators may attempt this sort of thing
though...

Generally speaking, there are two parts to the hard disk driver. There
is the driver itself which sits on the C partition (usually) and there
is the icon(s) on the desktop to access the partition(s).

If the C: icon is missing click once on one of the floppy icons so
that it is selected. Now look in the menubar for the "Options" item
and select it. In the "Drive Identifier" field enter the 'C' (make
sure it is an uppercase C, as a lowercase c will open the cartridge
port). Click on the "Install" button.

At this point you will find a C icon on the desktop. Double click on
it. If the driver is there a window will open and you're in business.
Do similar for any other partitions which are missing.

If it is not there you will get a message box telling you the device
is not responding. In this case you will need to install the driver
which will be on one of your original floppies somewhere - then do the
above again. Once the hard disk boots itself use "Options->Save
Desktop" to ensure those partition icons remain available on the
desktop.

If you have no hard disk software on a floppy (you should) all is not
lost. You can download a driver off an FTP site but I'll leave that to
others to explain if necessary.

>I am literate with PC hard
>drive installation etc.., but this is really weird.

Hehe. It's the other way round. Again, generally speaking the PC
terminology for "partitioning" and "formatting" is reversed. On a PC
you partition the hd then format each partition but for the rest of
the world "format" means wipe the whole hard disk clean including all
partitions on it! You then divide your formatted hd into partitions.

Note also if you do have to download a different driver then you stand
a good chance of being able to keep all the data which is still on the
hard disk - atari drivers aren't very fussy. :-)

Using HD floppy disks formatted in DD mode (720K on a double sided ST drive), is not wise.

The HD floppy magnetic coating is physically different from the DD coating, as it requires a smaller magnetic field to write on smaller particles. In DD mode, you are using a stronger magnetic field, therefore you might be affecting the particles around the ones you want to write to, thus corrupting any data already written on them.

As a summary, it might work for a while, but don't use those disks to backup important information or for intensive use, as you will find that many of these disks will eventually fail.

5075. Q: ST-1480N and what ACSI->SCSI to use

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-26 00:00:00 UTC
From: Markus Egg <Markus.Egg@vcpc.univie.ac.at>
Message-ID: <351A52C8.DF1E79E3@vcpc.univie.ac.at>
Source record: 13460

Hello,

I came up with a similar question some time ago but
now I've got more technical information.

I'll probably get a ST-1480N harddrive and want to connect
it to my ATARI Mega 2 or my ATARI STF 1040.

Some technical data that I found for the ST-1480N
(at http://www.seagate.com/cgi-bin/view.cgi?/scsi/st1480n.txt):

ST - 1480N

UNFORMATTED CAPACITY (MB) _____492
FORMATTED CAPACITY (xx SECTORS) (MB) _____426*
AVERAGE SECTORS PER TRACK _____62
ACTUATOR TYPE _____VOICE COIL
TRACKS _____13,302
CYLINDERS _____1476 (user)
HEADS _____9
DISCS _____5
MEDIA TYPE _____THIN FILM
RECORDING METHOD _____ZBR
INTERNAL TRANSFER RATE (mbits/sec) _____17 to 25
SPINDLE SPEED (RPM) _____4,412
AVERAGE LATENCY (mSEC) _____6.8

REDUCED WRITE CURRENT (cyl) _____N/A

LANDING ZONE (cyl)_____AUTO PARK
IBM AT DRIVE TYPE _____0 or NONE

I want to ask, which of the ACSI->SCSI adapters would be best
for this type of harddisk if I still want to use my
old 30 and 60 Megafile harddisks ?

I want to configure it like this:
ATARI computer-> ST-1480N(boot drive) -> Megafile 60 -> Megafile 30
|->(possible other SCSI devices)

because the Megafile 30 is unreliable (it failed once)
and the Megafile 30 should only contain "unimportant"
things.

Any thoughts, pointers, hints ...(errors in my concept) ?

Thanks in advance
ME

The card itself is described at the WB website, at the following URL:

http://members.aol.com/wbsystem/provor_e.html

However, this page has not been updated in a while, and I, too, would be
interested in any news as to what has happened lately, when it is expected
to ship, etc.

5081. Falcon SCSI II to ACSI ... just wiring?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-27 00:00:00 UTC
From: strads@tmisnet.com
Message-ID: <351b46ea.1823870@news.tmisnet.com>
Source record: 13466

Greetings!

Does anyone know if it's possible to wire the
appropriate 19 wires from the 50-pin SCSI-II
connector on the Falcon to the ACSI-dSub that
mates with the SLM-804 laser printer?

Are the signals and timing significantly
different, or is it just a matter of properly
wiring from connector A to connector B? If
it's just wiring, I'll see if I can have a
custom cable made so I can use my printer again.

>This is both true and false... there are some "tricks" to make it work
>properly... I remember having a really hard time figuring this out, but

Ah, that's interesting, for I used a binary editor in my original installation of GS to change the default drive, well it worked but I see that I've used the forward slashes in my gemgs.rc file.

>I haven't set any global environment variables elsewhere etc. so this

My second installation (this time 3.53) has all the paths set up as I said in my magx.inf file and removed from the gemgs.rc file, this seemed to be a more elegant solution to the problem. But to this day I cannot get the pshelp to work, although the plain text version of it does.

For MagiC I also renamed the GS binary to .prg to avoid the gtp parameters box.

David would be advised to edit the gemgs.rc file as per your suggestion as a start since that would be the easiest way! :-))

A friend of mine managed to get the ST1480N working with an
ICD hostadapter (link) on an Atari ST. Before long we try to use
the disk to boot a MegaST from.
The disk came in a Sun box and the jumpersettings had to be adapted:
automatic powerdown OFF
parity OFF

In this setup you cannot use the Megafiles, I guess.
With an internal hostadapter (AdScsi or Link2) that may work.

Nope, it's a pretty complicated task if we can judge by the price of the vapourware interface box that was announced a few years ago.

Without that, it's impossible to use an SLM on a Falcon. It seems that there are absolutely no consumable available anymore for that printer anyway.

As Uwe aready wrote WB has canceled the development of the SCSI-to Ethernet-adapter. But one of the developers wants to privately continue the development. They also seem willing to accept help from people with some knowledge of hardware and/orsoftware-skills.

The other possibility for an Ethernet conecection currently discussed is using a x-to-ISA-adapter (where x stands for VME, Mega-Bus, Falcon Expansion-socket ...) at which a standard NE2000-ISA-Ethernet card can be attached.

The current discussion in maus.sys.atari.hardware is which solution is easier to produce, and if the WB adapter can be brought to work at all.

Um - I think there was an interface called 'heatseeker' which attached to
the falcon's DSP port. I am not sure if it is still sold, but I read
somewhere that there were people using it.

Hi

You have been informed wisely. I know many people whom have bought high density disk because of there cheaper costs; bad move!

The recording media in HD disks are thinner than double density disks, hence double density drives use a stronger magnetic field to write to the disk and so can corrupt data on HD disks.

Some ST double density drives won't even read them. It isn't worth the risk, just because files load ok doesn't mean it will stay that way. Best to stick to standard Double Density disks.

If you have a high density drive fitted, you can use either disk. Obviously, double density disks will be formatted as double density and high density as high density:)

I hope this will answer your question regarding high density (HD) and double density (DD) disks.

Cheers! for now
Steve

But don't forget to say that a HD disk formatted as a DD disk in a HD
drive
is OK too! Just _don't_ format a HD disk as DD in a DD drive, it will
work
for a while, and then let you down when you need it most! (of course :)

Hello My name is Ian, I have a falcon not a TT but i believe i can help.

The tiny piece of software you need is AHDI or XHDI, YOu just run it and it installs the drive for a session. Ie start this program on floppy which then starts the hard drive. then use the HDUTIL program to install a bootable partition on to drive c:\.

If you want to get this done then e-mail me at

inorton_badrul@hotmail.com

newt.

> attached.

I have a third suggestion: Build a PCMCIA-adapter (perhaps for the
ROM-port?) and use a PCMCIA Ethernet-card. Yes, I know they are more
expencive than standard ISA-cards, but they're also a lot more
compact. Not everybody has a tower you know...

I really don't know much about PCMCIA, but as it's an open standard I
guess there are chips out there that should make it fairly simple to
adapt to the ST/TT/Falcon.

Correct.
It was connected to the external DSP port of the Falcon and needed
additional drivers.
I think it's supported no more.
(besides, it was a very weak connection because there were no screws at
the plug - no good thing at all, though it worked.)

Bye,
Carsten

I have a selection of Atari ST titles for sale.

This List Updated 27/3/1998.

email: steve@steverosie.demon.co.uk

I'm looking out for the following, possible swap, part exchange etc...
Atari CD ROMS, 16-bit sampler cartridge/hardware etc...

All are on original media.

Key:
ds = double sided disks
ss = single sided disks
?d = number of disks
meg = one meg of memory or more needed
ni = no instructions
nb = no box
NSTE = Not STE compatable

Please Note The Key Codes Are Only There For Guidance, I cannot be
responsable for in accuracies.

>>>>>>>>>> All prices are in UK Pounds (sterling) <<<<<<<<<<
^^

Prices DO NOT include postage.

GAME COMPILATIONS

Hollywood Collection (5d,ni) 5
Ghostbuster II, Indiana Jones and the Last Crusade & Robocop
TNT (4d) 5
Xybots, Toobin, APB, Dragon Spirit and Hard Drivin'
Finale (4d) 5
Paperboy, Overlander, Ghost'sn' Goblins
and Space Harrier (20 levels)
The Dream Team (5d, ds) 5
The Simpsons - Bart v' The Space Mutants, WWF Wrestlemania and
Terminator II 'Judgement Day'
Atari 520STE Discovery Xtra Pack 5
Language Disk DE1 (ds)
Final Fight Disks DE2 & DE3 (ds)
Sim City/Escape from the Planet of the Robot Monsters (ds)
9 Lives (ds)

SPORT TYPE GAMES

World Championship Soccer (1d,ds,nb) 2
Ballistix (1d,ss) 2
Superleague Soccer (1d,ss) 2
T.V Sports Football (1d,ss,nb) 3
Vector Championship Run (1d,ss) 2
Championship Wrestling (1d,ss) 3
Top Shot = Kick Off + Extra Time. (1d,ds) 3

SIMULATIONS

ATFII (Atdvanced Tactical Fighter II) (1d,ss) 2

Yes there is. If you have AHDI on floppy disk (hope so) then turn on your atari, hold down Shift, Control & Alternate, this should boot you without the hard disk. then insert the AHDI disk, run AHDI then delete the offending file.

let me know if you have problems

Hi

If you are using hddriver, and have a backup on floppy; then turn on
the computer and hold down the ALTERNATE button and allow to boot from
floppy or run HDDRIVER.PRG from the desktop and remove affending file.

This is when a boot manager like SUPERBOOT comes in very handy:)

If you are a floppy only system, replace the disk with any formatted
disk or wait about 2 minutes for the desktop to appear.

If I can be of further help please let me know:)

Cheers! for now
Steve

Interesting point. Do you have any documentation about PCMCIA, or can you
point me to online-specs ?

Cheers Peter

Peter,

Fortunately there is an easy solution; boot from a floppy by holding the alternate key down during the beginning of the boot process; load your hard disk driver from a floppy; install the harddisk icon using install drives from the desktop; delete the offending program; reboot normally.

Also, if you have a high enough version of TOS, there is a way to bypass the auto folder. I can't remember which key you hold down. Can anyone else?

5108. Hack a GEM game (Empire) to use higher resolutions?

Newsgroup: comp.sys.atari.st.tech
Date: 1998-03-29 00:00:00 UTC
From: Trevor Cordes <trevor@cyberspc.mb.ca>
Message-ID: <351E10A3.A23EB6DC@cyberspc.mb.ca>
Source record: 13493

Hello, I'm wondering if anyone can help with what seems like should be a simple problem.

I recently got addicted to the game Empire again. I play it on my AIX UNIX box using STonx. Empire is a GEM-based game, with a window & menus, etc. It works in ST medium and ST high. However, since STonx lets me make my emulation vdi screen as big as I want (like 1024x768), I would like to play Empire in that rez where I could probably view the whole map at once and not have to scroll!

The problem is, if I run STonx in any non-standard rez, Empire complains that I must be in med or hi. Assuming the programmers "cleanly" programmed their GEM code to get the screen size from VDI enquires instead of hard coding it in based on med/hi choice, it might be possible to make the prg instantly higher-rez capable by no-op'ing out the screen rez check(?).

Does anyone know if this can be done easily and/or is willing to give it a try?

If the Empire authors read this, please consider tweaking your source and releasing the game perhaps as shareware. It's one of the all-time best ST games and still stands up in addictiveness to modern PC war games. Great job!

I want to run Empire in 648*480 on magic 5, if anyone can hack empire to stop it moaning about reses then i'd like that too, empire was my fav game until i couldnt play it on my falcon.

Has anyone tried Conquest, this game runs in all 16 col screen reses, from 320*200 in 16 to 1024*768*256, It is much better than empire and has loads of things including nukes, it is very similar to empire and you will instantly like it. it is in UMICH atari archive, in the games/strategy folder and is called conqu097b.lzh or something.

newt,

A search on AltaVista should give plenty of hits. There is also a
standard for network/modem-cards which should provide programmers with
all necessary information on how to write drivers.

Although it may seem like it could be some "smart little program", speech recognition is no trivial matter. It's extremely difficult to do accurate recognition.

There was a speech recognition program of some sort for the Falcon a while back, but I'm not sure what happened to it or where it can be obtained now. I never tried it myself.

That's not possible I'm afraid.

Go to http://www.cix.co.uk/~derryck/software.htm for a software solution to using an ST and SLM laser printer with your Falcon (or indeed any other computer where you can redirect HP Laserjet driver output to the serial port or to a disk file).

It works very well with NVDI and Papyrus, with Calamus SL you need a print to disk spooler such as GEMSpooler and click on the "Other" button in the print dialogue.

I have somewhere on my pages the PCB of an adaptor to connect a D-link
DE600 parallel port adaptor to the cartridge port of any(?) atari. One
problem : the DE600 isn't available anymore and I don't know if it's
succesor, the DE620, will work with it and with the drivers.
A question about this. Wouldn't it be possible to connect such an
adaptor immediately to the parallel port of a Falcon, or does the Falcon
still has the same parallel port configuration as the ST?

Did anyone hear something about a PCI-brigde for the Falcon?

And what about the network software? When someone develops a network
card, will it support ANS? Will it be compatible with the micro$oft
network neighbourhood or with Netware? I guess this are also important
questions, definetely if you want to use your atari in a heterogenous
network.

There is no such thing as an internal drive for the Atari ST, as the ST has
no internal connector for a hard drive, except for those with a special
adapter board.

As far as I can tell, it's a perfectly normal IDE drive suitable for any old
PC laptop or a Falcon

>Don't ask me how to install it. I have included a scanned image of the

I am having a problem gettings an external SCSI CD-ROM drive (Apple 300E) running on my STE.

My setup is as follows:
4 meg STE running under TOS 1.62 & 2.06 (not at the same time:))
System solutions MiniS Hard drive.
Using the adapter that was supplied with it in 1994, SS say it's an ICD.

HDdriver v3.10 will not allow any drive to initialise, let alone run. The hard drive locks up, no matter what you do.

I have downloaded the HDdriver v71.0 demo with mixed success; in 1.62 & 2.06 if the hard drive doesn't hangup on me (yellow light stuck on), it acknowledges the CD-ROM drives existance, but only allows me to acces partitions C-H instead of C-J on my hard drive. Using MetaDOS v2.70 under 1.62 the computer bombs out when the CD-ROM is opened; in 2.06 I can actually view the directory:) But when any attempt to run any install program etc... the computer crashes.

As I have met with limited success with the demo version of HDdriver 7.10, and as System Solution has failed to convince me that upgrading to the full version would get me sorted I don't want to splash out money on a wild goose chase based on a salesman selling his trade.

Has anyone been through the same problems, if so how was it overcome? I don't mind buying software, on condition that it does what I want it to.

If any dristibutor, producer or writer of these commercial or any driver package could be so kind as to forward me a copy of their software and it does the job I want (which is to get this CD-ROM drive so that I can use it) I can't see a problem with me buying it. simple enough.

Any help will be greatly appreciated, and I mean that, I really do, I'm not kidding, It'll make my day, or millenium, I'll be forever in your debt, I'll definitely owe you a favour, and I mean that most sincerely folks..... :))))))

Thanks

Cheers! for now
Steve

Source record: 13415

I've just got a mega STE and i was wondering where an internal hard drive plugs into the board. I pressume there must be an internal asci/scsi connector like the mega. Also what do the bank of dip switches infront of the simms control?

I'm also having problems with the blitter. When it is turned on with the control panel the screen messes up. If the machine is booted without the blitter switched of a dialog comes up saying something like unable to allocate window memory and the screen is totally corrupt. Is the blitter buggered then?

Hope somebody can help with these points.

Niall

5131. Ethernet card

The real trick should be that any software should be written so that the end user has to spend as little time setting it up as possible. Why is it that you get software and you have to screw with this and
that just to get it to work? What ever happen to a good configuration file for them.It is real BS that anyone should have to go through such nonsence to just get the damn thing to work like it should of out
of the package. Why is it? Hello we all don't have a Falcon or a TT out here either or n either do some of us want them either. What can't you make a program work on the older machines and and if perhaps
the user has a new faster machine load special code to take advantage of it? Is this really asking to much from the programmers? Seems to me that alot more people would be available to purchase good
software this way. Well now that I got all that out. Have a good day!

Source record: 13418

Generally speaking, you will have to supply all or most of the
power to the external hd. The Falcon can only supply ~1/2 ampere
at 5vdc and NO 12vdc.

Data must be routed from the 44 conductor 'PS/2' cabling scheme on
the Falcon mainboard to the 40 conductor used with 3.5" IDE drives.
41 thru 44 have to do with power to the 2.5" hd, so you can leave them
unconnected. 1 thru 40 are pin for pin identical in either scheme.

Atari vendors MAY have ready-made cable adapters for you, else
solder them up yourself.

If PS can't find a particular font it's supposed to use one called
"ugly.gsf" as far as I remember. I'm wondering if there is still a problem
with your stgs.rc file. Don't know what you mean about nccr.pfa, that's a
Courier font?

I don't think the full version will change anything. But as you're
experiencing some unique problems it's quite likely that there is some
kind of hardware problem.
Note that HDDRIVER will only offer partitions that have correct
parameters and that these parameters must be compatible with your
version of GEMDOS. A partition larger than 256 MByte won't be available
on old versions of TOS, for example, because TOS 1.0 doesn't support
partitions of this size. See the online help in the partitioning dialog
box of HDDRUTIL for more information about partition sizes.

Hi Steve!

I haven't actually used a CD with my Atari, but I know there are several other drivers to try out.
(From what I've heard MetaDOS really suck...)

Try Spin! or ExtenDOS. I think ExtenDOS is free, but I don't know about Spin!.

Good luck!

/Peter

It looks like the problem I had: for whatever reason the fontmap file was
NEVER extracted (both with the old v2.6x and the "new" 2.53b). Someone
send it to me and it works now.

Bye,
/Pascal/

Yes, even though the Mega has no RF Modulator, it can still be done:

-If your TV has a SCART/Peritel connector (most modern TVs do, at least
in Europe), you can either buy an RGB Atari/SCART cable (from an Atari
dealer), or make one yourself. If you choose the latter, you'll find the
pinouts in the Quick FAQ.

There is an Atari dealer in the Netherlands, called, MABN. They have a
webpage at http://www.xs4all.nl/~mabn/

-If not, you'll need an RGB to PAL converter, these are a bit expensive,
and image quality is not great, but they work. You'll have to make an
adapter from the converter's RGB socket to the Atari monitor port.

I really don't think so. The interfaces have nothing in common. Maybe you
can use the mechanism in the Mega, but I'm not even sure the drive
mechanisms are the same.

Hmm...Nicholas, I'm not sure either. I do know that the Amiga file system
is radically different. It formats out to 880k without any enhancements,
on any stock Amiga. (DS/DD). I don't know whether that is a function of
the OS or the mech itself. I know if you buy a 1.44 drive for the Amiga,
from the PC world, it won't work, and the custom 3rd party ones for the
Amiga A1200 and A4000 are expensive. (like $115.00!) ;-)

I'm afraid that I know very little about HDdriver, but I suspect that it is
not your problem.

You must consider termination with multiple drives. Is your first drive
terminated (resistor packs or switches?) Is your last drive terminated (I
recommend a pass-through terminator -- costs about $10). Are all other drives
NOT terminated?

You must consider cables. Are you using good condition (preferably short)
cables? A cable that has been mistreated (twisted, etc.) may look fine, but
often will not work. I treat my cables like china, having gone through "bad
cable hell".

If neither of these are your trouble, I'd recommend changing software.
Extendos Pro works beautifully for me, and I happen to know it supports the
Apple 300 (though I've never actually tried that drive myself).

I have a MegaSTE with the same problems and more. It doesn't read hard drive directories properly, it will only display about 10 folders or files but it displays about a dozen of each.

I've never figured out what the problem is. I had it in for repairs when there used to be a local Atari shop. They thought it was the GLUE/MCU chip and replaced it. Didn't work. I then bought another MegaSTE and tried replacing all the socketed chips one by one, nothing helped. I then thought it might be the DMA chip so I ordered one up from Best Electonics. I tried to replace it, big mistake. This MegaSTE has the DMA chip soldered to the board. Why, oh why did I try to replace that myself. Anyway, that computer is now toast and is being used as parts for the second one I bought.

Even with the fastest settings of the SCC-Ports, which is 230 kbps, and which
works hardly reliable given the 4 byte buffer and CPU speed of Falcons, is
by a *factor* of 44 slower than Ethernet, which makes 10 Mbps ! So a serial
to Ethernet adaptor can't be anything but a bad kludge.

Cheers Peter

Hi Steve Stupple <steve@steverosie.demon.co.uk>,

Whn I needed a US Robotics manual for a modem, I contacted them at
Reading. I think it cost me ï¿½8.00!

I don't use Teddy Term, so this info may need a bit off fiddling to get it working with that one.

If you're doing it over the phone, dial the number of the person you're wanting 'talk to'. At the other end, when the phone rings, enter 'ATA' while using the terminal screen. This will tell the modem to answer the call and you should connect.

You will probably want 'local echo' turned on, otherwise you won't see what you're typing, only what the other one is typing.

I know this will work with Freeze Dried Terminal and Uniterm, since I use this sometimes to transfer to a friends Acorn. The freeware FTP package isn't that stable, so I will sometimes get files for him.

> Any help would be appreciated.

Well, hope this helps.

It should work. I tried it myself once. Only radical difference is that Amiga floppy has electronics that signals disk change, while others in general does not. So, if you would try to do opposite and fit ST's floppy into Amiga, it would read first floppy fine, but Amiga would not recognise change of disk, so you could use just the disk that was in unit at boot-up. I tried that with A500, maybe they have come to senses and use more standard units in newer models (A1200 etc.).

Where does an internal host adaptor fit in the megaSTE? There is a likely looking slot net to the floppy slot at back rear right of the machine but it apears to have jumpers attached to some pins.

Hope you can help

Niall

5157. How to transfer Tape TAR file to Disk (without extracting files)

Newsgroup: comp.sys.atari.st.tech
Date: 1998-04-02 00:00:00 UTC
From: pls@no.spam
Message-ID: <6fvg2j$rk4@bcrkh13.bnr.ca>
Source record: 13247

HI

I have a tar file (approx 100 MBytes) on tape that I want to transfer to my STFM. I normally use Tapebios with GTAR, which works well.

For this particular tar file, which was created on a MAC, there are a lot of files with very similar names. I extracted the TAR file into a Minix partition, but many files were not written to the disk because they had the same first 8 characters as other files.

I figure GTAR (it's an old program, based on TAR 1.10) is not Minix/MiNT aware, the newer TAR programs might be able to extract the full names.

I have tried to pipe the output of GTAR to TAR, but this does not work.

Is there any way to copy the Tape TAR file to disk without extracting the files?

I realise part of my problem is my tape setup, i.e if I had a proper tape driver & the tape was installed as /u/dev/tape, then I should be able to cp from the tape to the disk.

Unfortunatly, I have not been able to find a working MiNT tape driver.

5159. TOS 1.09

Newsgroup: comp.sys.atari.st.tech
Date: 1998-04-02 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <6fvs1tivm2@newshost.comnet.co.nz>
Source record: 13249
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

What exactly is TOS 1.09?

From the late 1980s, British Atari mags frequently mentioned TOS 1.09,
but, AFAIK, there never was a TOS version labelled 1.09.

From descriptions of it, I am led to believe that it is really TOS 1.02
"Blitter TOS" (or "Mega TOS", if you prefer)

Can anyone enlighten me as to where the moniker "1.09" came from?

AFAICR, none of the internal version numbers (AES, GEMDOS etc) in that TOS
version were 1.09, so it is unlikely to be a case of transposed version
numbers.

--

All email sent to my inca address will fail, however I can now be
contacted via an intermediary : gem at tos pl net. I would like to
apologise to the genuine respondents that this may inconvenience.
